

DustPedia: Multiwavelength Imagery & Photometry of 875 Nearby Galaxies in 42 Bands

Chris Clark
Sam Verstocken
Simone Bianchi
& the DustPedia team

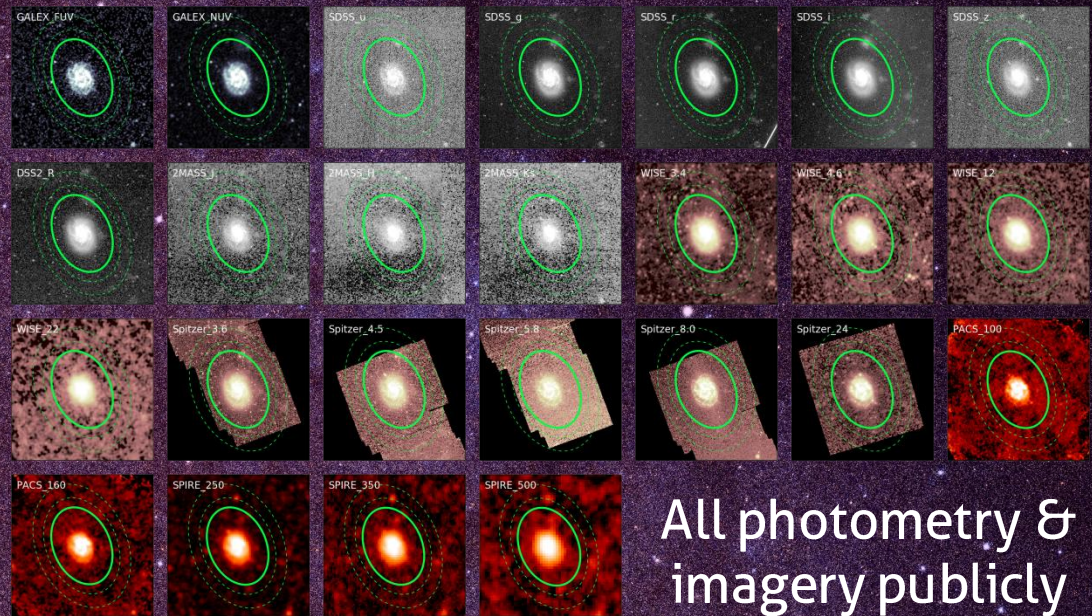

Covering all 875 nearby ($D < 40$ Mpc) extended ($1' < D_{25} < 1^\circ$) galaxies observed by *Herschel*

Custom *Herschel* reductions plus standardised ancillary imaging data spanning 42 UV–microwave bands

Consistent 27-band aperture-matched photometry, plus *Planck* and IRAS catalogue fluxes

21857 photometric measurements (averaging 25 fluxes per galaxy)

Our CAAPR multiwavelength aperture photometry pipeline freely available on GitHub

 DustPedia

All photometry & imagery publicly available at:
