Galaxy cluster modelling

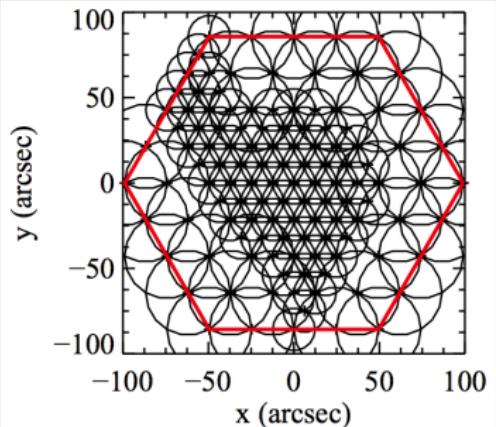

Model-based method

Mahler et al.(2018)

- + Physical solution (ex : isothermal sphere).
- ± Iterative work of modelling.
- Assumption on the shape of potential (symmetry,...).

Model-free method

Jullo et al.(2009)

- + No assumption on the shape.
- Can lead to unphysical results.
- Models are strongly degenerated.

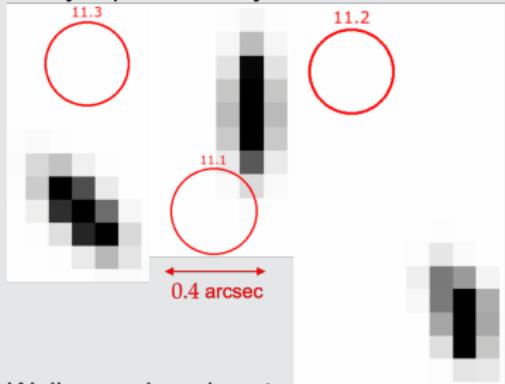

Limitation of the parametric modelling

Many high-quality constraints

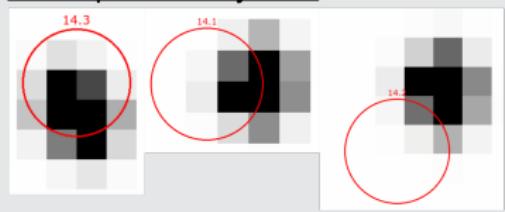

Models accuracy

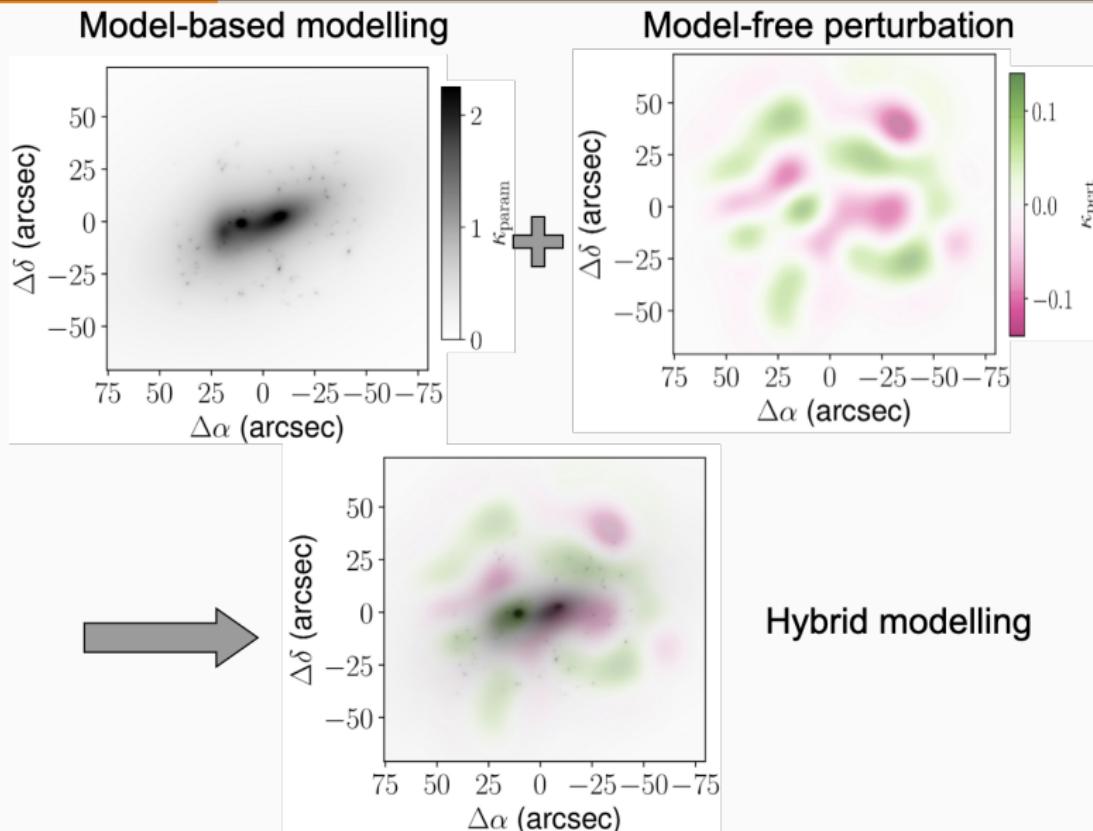

Badly reproduced system:

Well reproduced system:

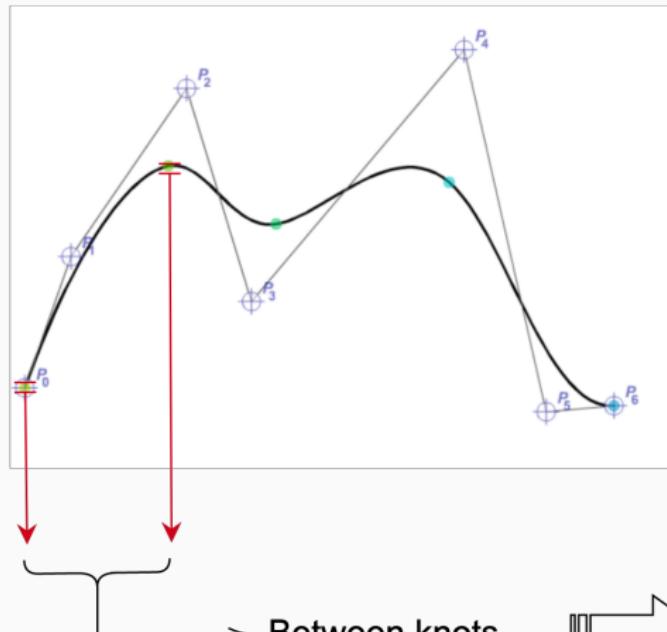

Hybrid approach

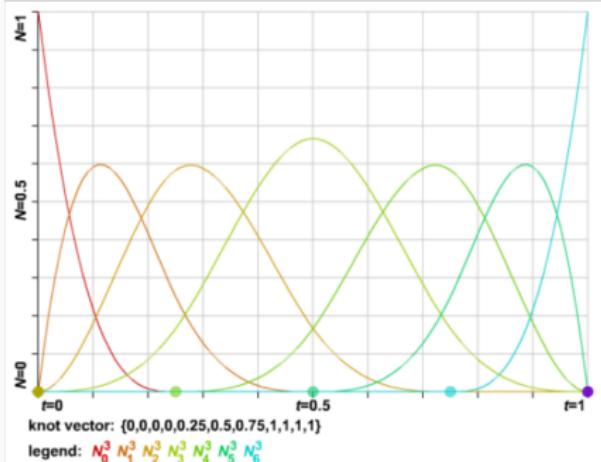

A B-spline perturbation

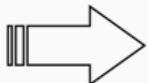

Spline function

Basis functions: B-splines

Between knots

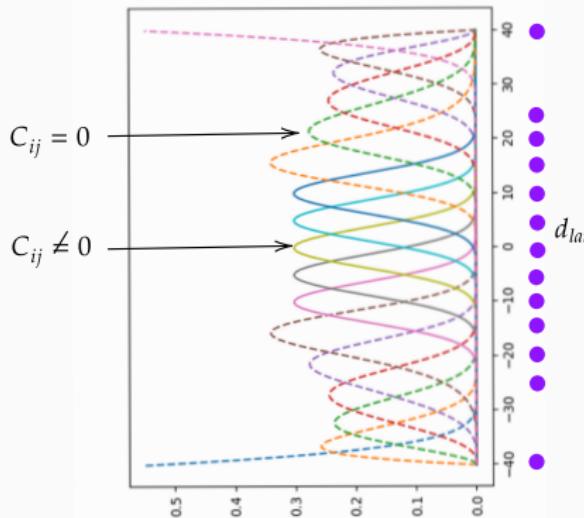

Polynomial functions

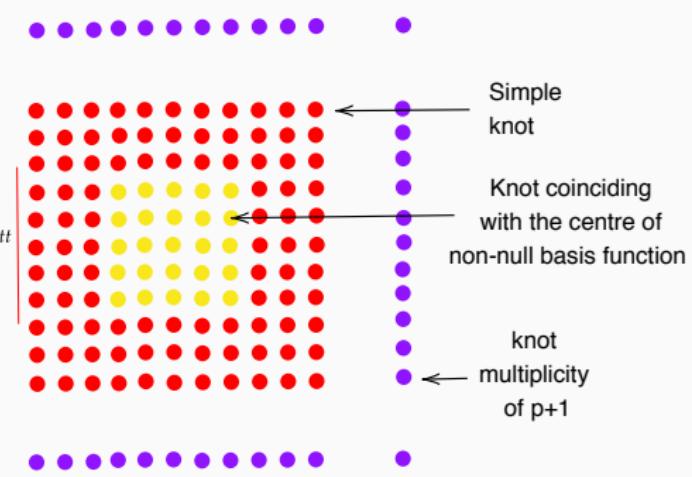

A B-spline perturbation : Surface definition

$$\Delta\psi(x, y) = \frac{D_{ls}}{D_s} \sum_{j,l=1}^m C_{j,l} B_{j,p,t_x}(x) B_{l,p,t_y}(y) \quad (1)$$

B-spline basis cross-section

Knot Mesh

A B-spline perturbation : Pros and cons

Perturbation on the lensing potential

Pro

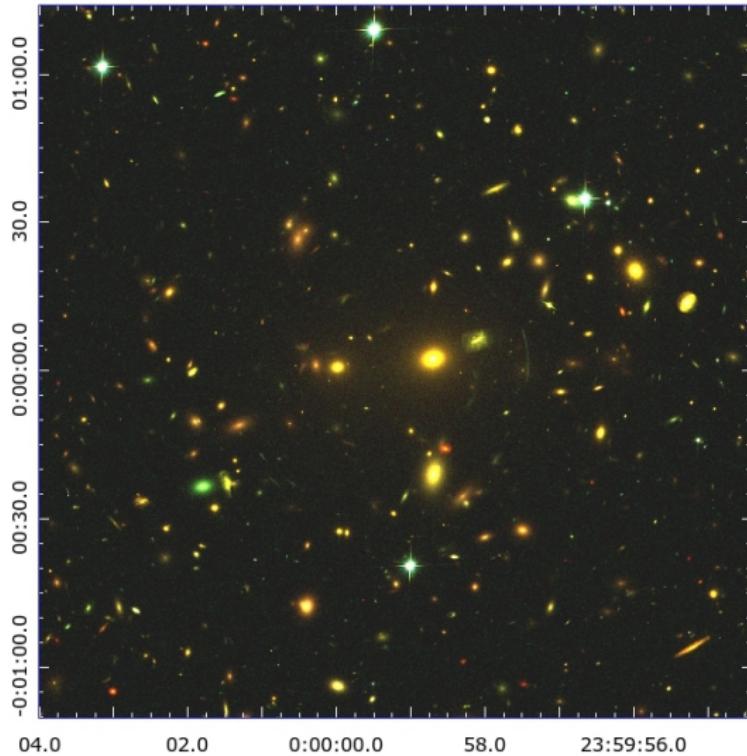

- Direct modification of the mass distribution
- Locality
- Easy to compute

Cons

- Redistributing the mass only
- Squared shapes
- Boundary effect

Hera Cluster : A realistic simulation of galaxy cluster

Declination

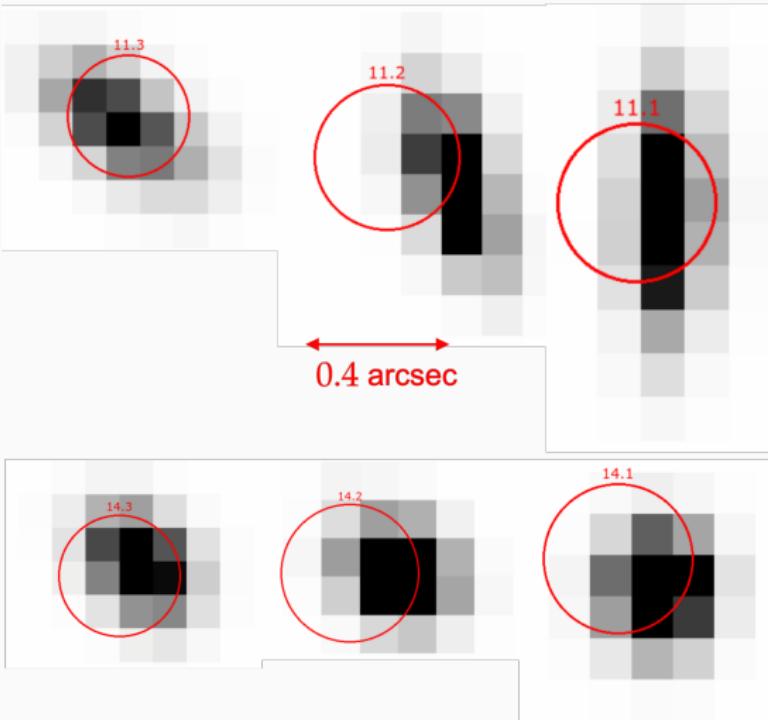

Right Ascension

Hera Cluster

- Large scale N-body simulation
- Similar to HFF clusters

Meneghetti et al. (2017)

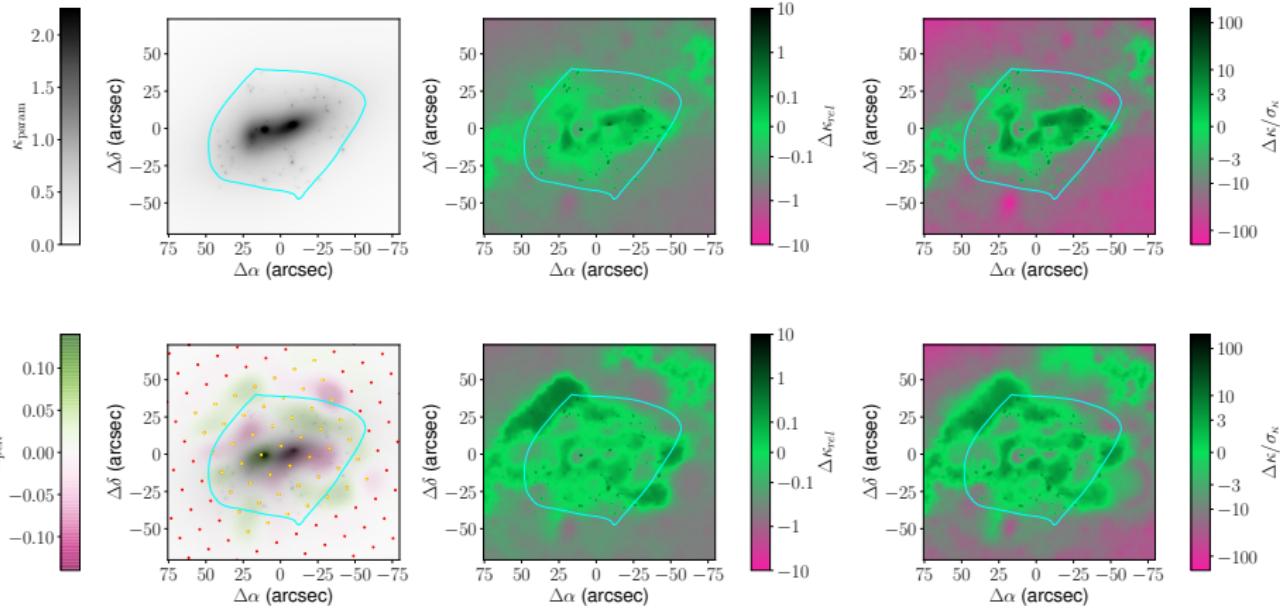

Deflection angle field

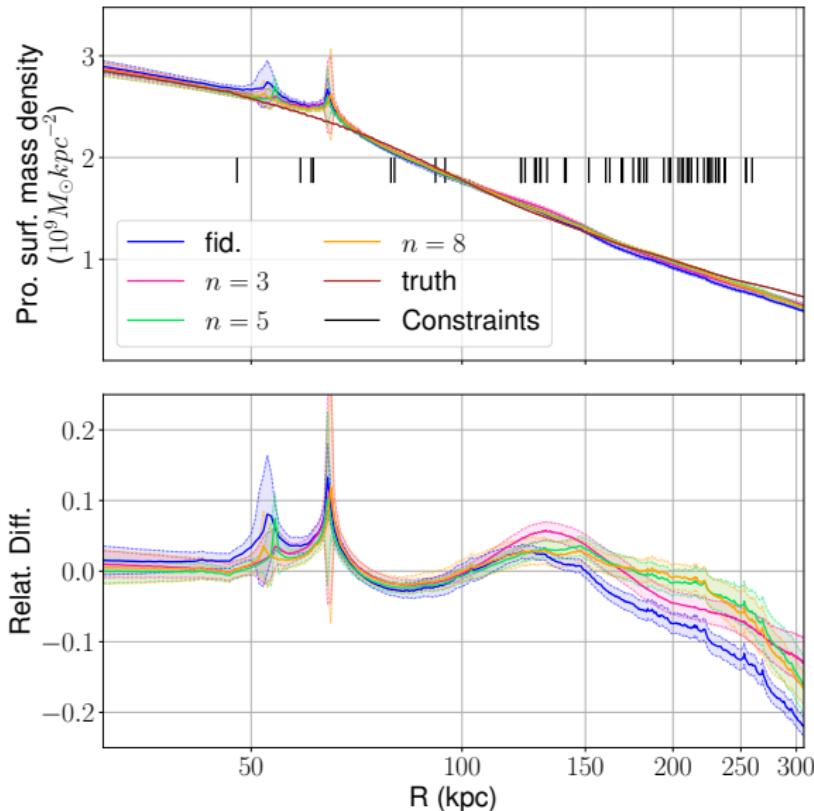

Root-mean-squared Error

- Decrease by a factor $\sim 3 - 4$.
- Reduction of the RMS spreading among all systems.

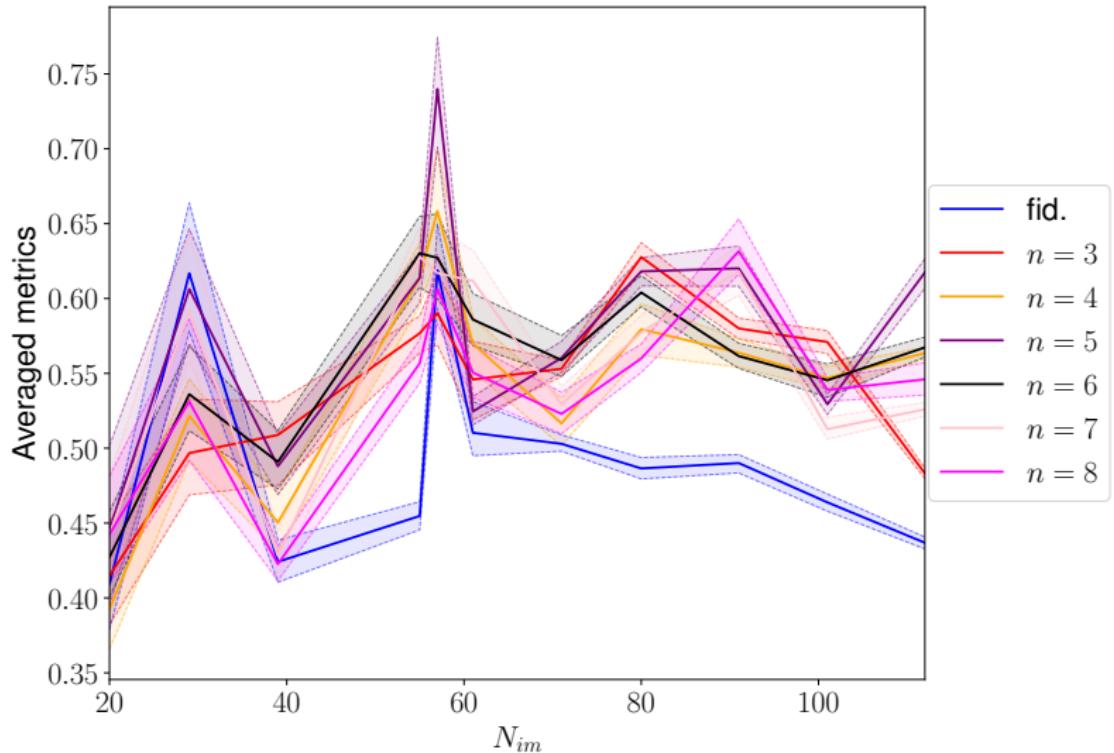

Mass distribution : 2D field

Mass distribution : Profiles

Evolution with the number of constraints

Conclusion

Key points :

Modelling :

- A hybrid modelling : Benefits from both approaches.

Results :

- Better fit of the deflection angle field.
- More accurate reconstruction of the projected mass distribution.

Thank you for listening
