

Characteristic length and time scales

Lund University / Physical Chemistry / Applications of X-ray and neutron scattering / August 2012 / 1

Two generic experiments for dynamic information

$$\text{Scattering vector } q = (4\pi/\lambda)\sin(\theta/2)$$

$$\text{spatial resolution } \sim 1/q$$

One possible solution: Neutron spin echo experiments

inelastic/quasielastic

detector

$$\omega_s, \Delta\omega_s$$

$$I(\omega_s)$$

$$\langle I(\omega_s) \rangle$$

$$I(\omega_s)$$

Problems:

- Line width for soft matter samples

$$\Gamma = Dq^2$$

Example: nanoparticle, $R = 10 \text{ nm}$

$$D = 2.5 \times 10^{-11} \text{ m}^2/\text{s}$$

$$\text{for } q = 0.6 \text{ nm}^{-1} \rightarrow \Gamma = 9 \times 10^6 \text{ s}^{-1}$$

- Intensity

Lund University / Physical Chemistry / Applications of X-ray and neutron scattering / August 2012 / 2

The neutron spin

Is there any information the neutron carries with itself?

— Yes:

Spin Direction

Neutron spin in magnetic field described by

Bloch equation:

$$\frac{d\mathbf{P}}{dt} = \frac{g_n \mu_N}{h} (\mathbf{P} \times \mathbf{B})$$

Larmor precession in constant field:

$$\omega_L = \frac{g_n \mu_N}{h} B \leftrightarrow 2900 \frac{\text{rot/s}}{\text{Gauss}}$$

... used as individual stop-watch

NSE Theory

Precession angle mismatch:

$$\Delta\phi = \left(\frac{2\pi |g_n| \mu_N m_n}{h^2} \right) B l (\lambda_f - \lambda_i) \approx \underbrace{\frac{|g_n| \mu_N m_n \lambda^3 B l}{h^3}}_{t_{\text{NSE}}(B)} \omega$$

sensitivity proportional to λ^3

⇒ Loss of polarization:

$$P = \cos \Delta\phi$$

time parameter proportional to B and current

... averaged over all scattered neutrons:

$$P(Q, t_{\text{NSE}}) = \frac{\int_{-\infty}^{\infty} S(Q, \omega) \cos(\omega t_{\text{NSE}}) d\omega}{\int_{-\infty}^{\infty} S(Q, \omega) d\omega} = \frac{I(Q, t_{\text{NSE}})}{I(Q, 0)}$$

Neutron Spin Echo measures directly the normalized intermediate scattering function!

(courtesy R. Zorn, Bombannes-Lectures)

Example: Diffusion of concentrated proteins

measurement of $S(q,t)$ for concentrated protein solutions, covering the appropriate length and time scales

Two generic experiments for dynamic information

A short introduction to dynamic light scattering

Interlude: Particle dynamics in real and reciprocal space

Particle tracking with a microscope

Dynamics in reciprocal (Fourier) space

Interlude: Particle dynamics in real and reciprocal space

Particle tracking with a microscope

J. B. Perrin, "Mouvement brownien et réalité moléculaire," *Ann. de Chimie et de Physique (VIII)* 18, 5-114 (1909)

Interlude: Particle dynamics in real and reciprocal space

Dynamics in reciprocal (Fourier) space:

The typical time scale for the duration of a fluctuation is determined by the time it takes the relative phase differences between the two paths to change by approximately unity.

Interlude: Particle dynamics in real and reciprocal space

Dynamics in reciprocal (Fourier) space:

Structure of intermediate scattering function, $f(q,\tau)$, gives information on scatterer dynamics

Measuring dynamics

$$g_2(q,t) = \frac{\langle I(q,t') I(q,t'+t) \rangle}{\langle I(q,t') \rangle^2}$$

$$g_2(q,t) \sim e^{-2\Gamma t}$$

$$\Gamma = Dq^2$$

Correlation functions for a dilute colloidal suspension

PS, 71 nm in glycerol

(L. Lurio)

Other examples:

concentrated particle suspensions

$$D(Q) = D_0 H(Q) / S(Q)$$

Concentrated Block Copolymer Vesicles

Fahn et al. PRL 94, 16105, 2005

Atomic Diffusion in Metal Alloys

Leimer et al. Nature Materials, 2009

Antiferromagnetic Domain Fluctuations

• O. G. Shpyrko et al., Nature 447, 68 (2007).

Note that although the length scale of the fluctuations is large (>10 nm) they require x-rays with wavelengths ~ 0.1 nm in order to be visible.

Scattering techniques, length and time scales

Structure

SANS: $10^{-3} < q < 1 \text{ \AA}^{-1}$ SAXS: $10^{-3} < q < 1 \text{ \AA}^{-1}$ ESRF
 $10^{-2} < q < 1 \text{ \AA}^{-1}$ Lab.

SANS/SAXS: $10^{-3} < q < 1 \text{ \AA}^{-1}$
 USALS/SLS: $2 \times 10^{-5} < q < 2.5 \times 10^{-3} \text{ \AA}^{-1}$

Dynamics

Lund University / Physical Chemistry / Applications of X-ray and neutron scattering / August 2012 / 19

Advantages and disadvantages

NSE

- + no beam damage
- + isotope-selective
- + large q-range
- limited time window ($< 1 \text{ \mu s}$)

XPCS

- + large q-range
- + in principle large time window, but currently limited because of detectors
- beam damage
- limited signal (low coherence of x-rays)
