100/446 shown, max E (GeV) == 56675.77

100/444 shown, max E (GeV) == 1.58

Track topology

(e.g. induced by muon neutrino)

Good pointing,

$0.2^\circ - 1^\circ$

Lower bound on energy
for through-going events

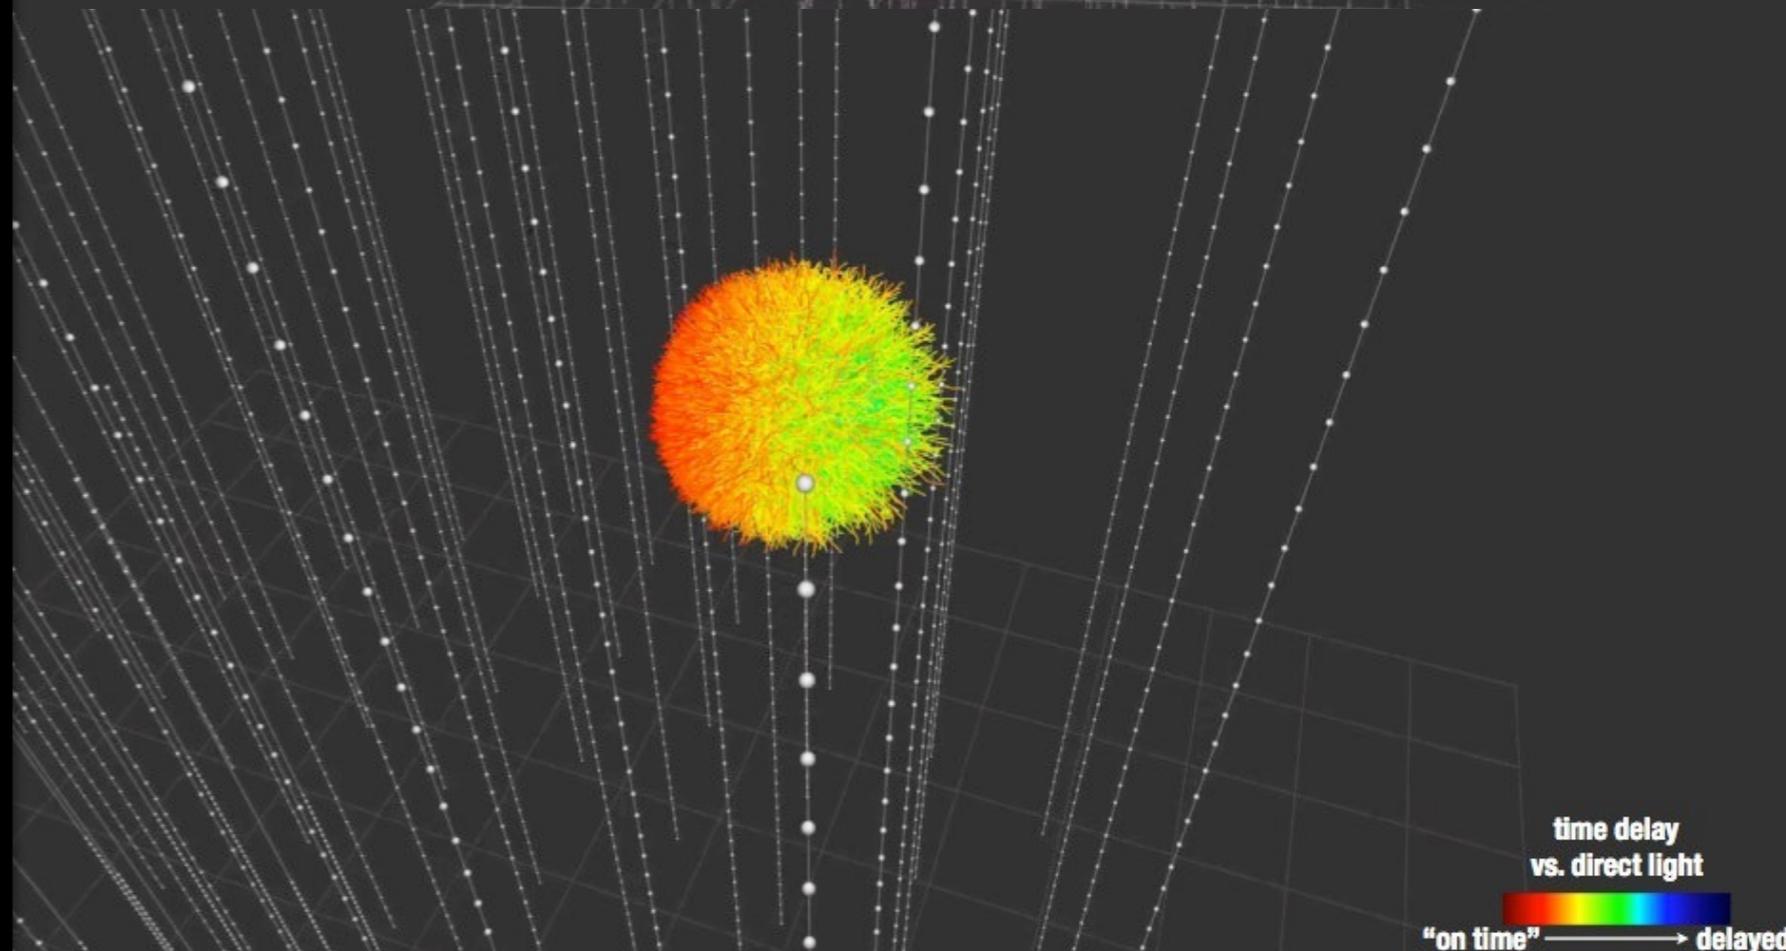

Cascade topology

(e.g. induced by electron neutrino)

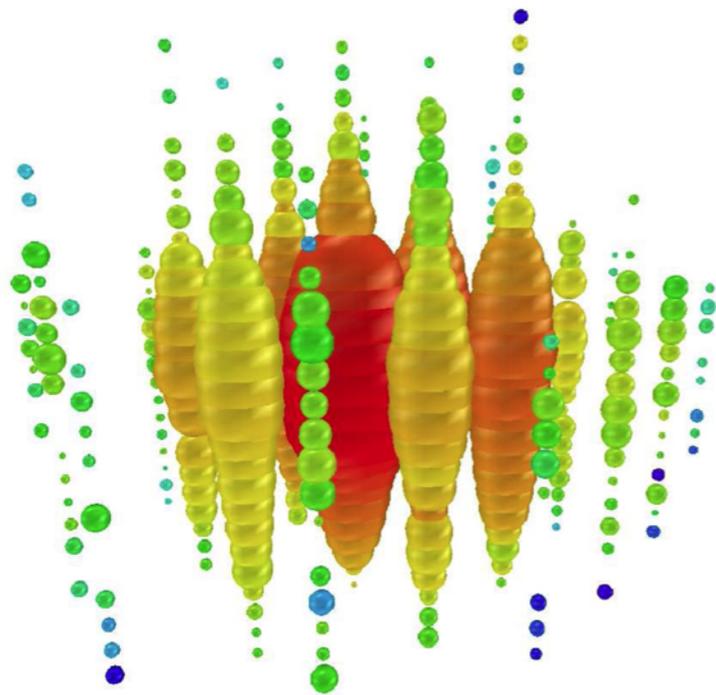

Good energy resolution,
15%

Some pointing,
 $10^\circ - 15^\circ$

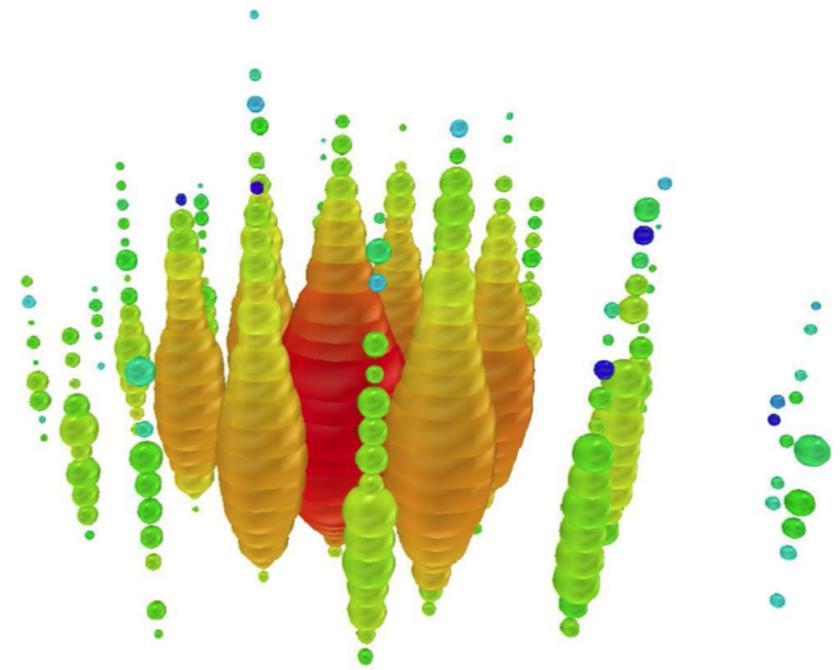

Very High Energy

- Very high energy IceCube (GZK) astrophysical search found 2 anomalous background events in 2 years of data

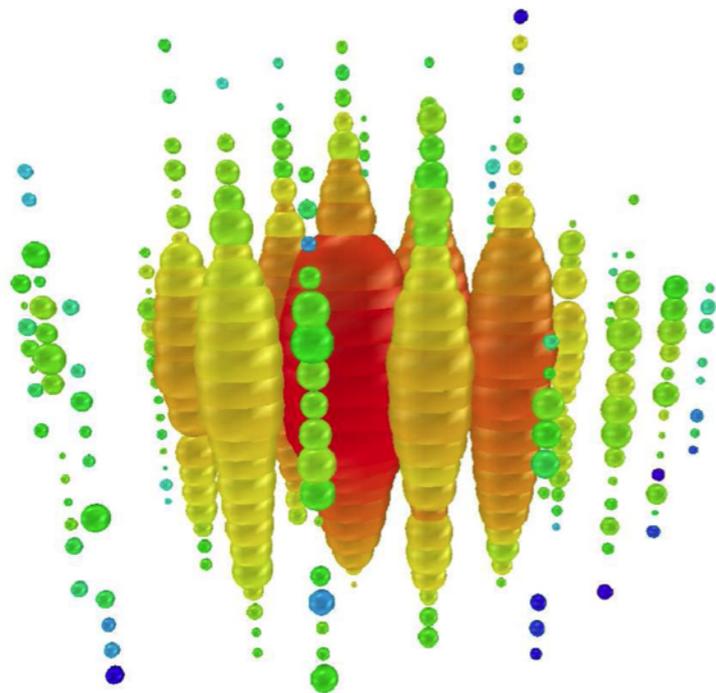

1.04 ± 0.16 PeV

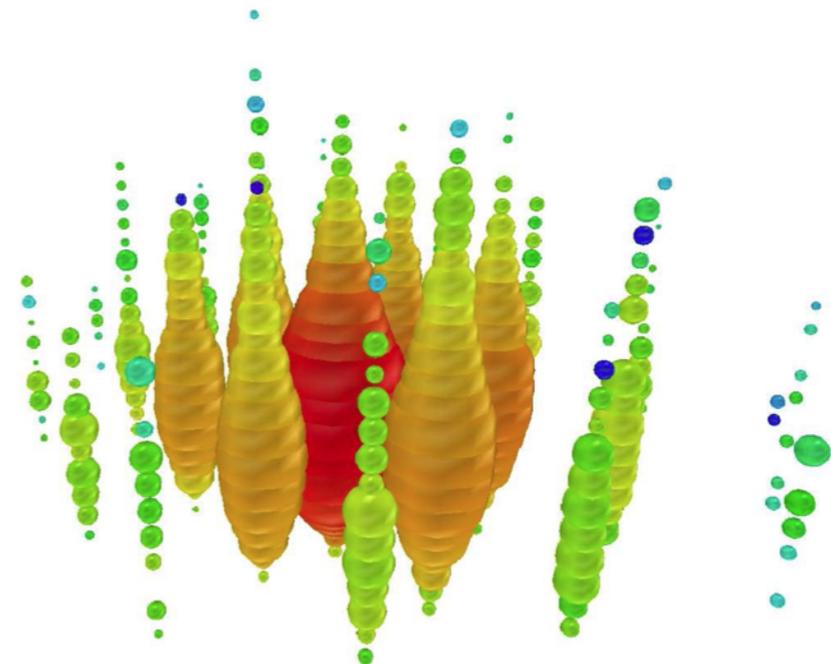

1.14 ± 0.17 PeV

Very High Energy

- Very high energy IceCube (GZK) astrophysical search found 2 anomalous background events in 2 years of data

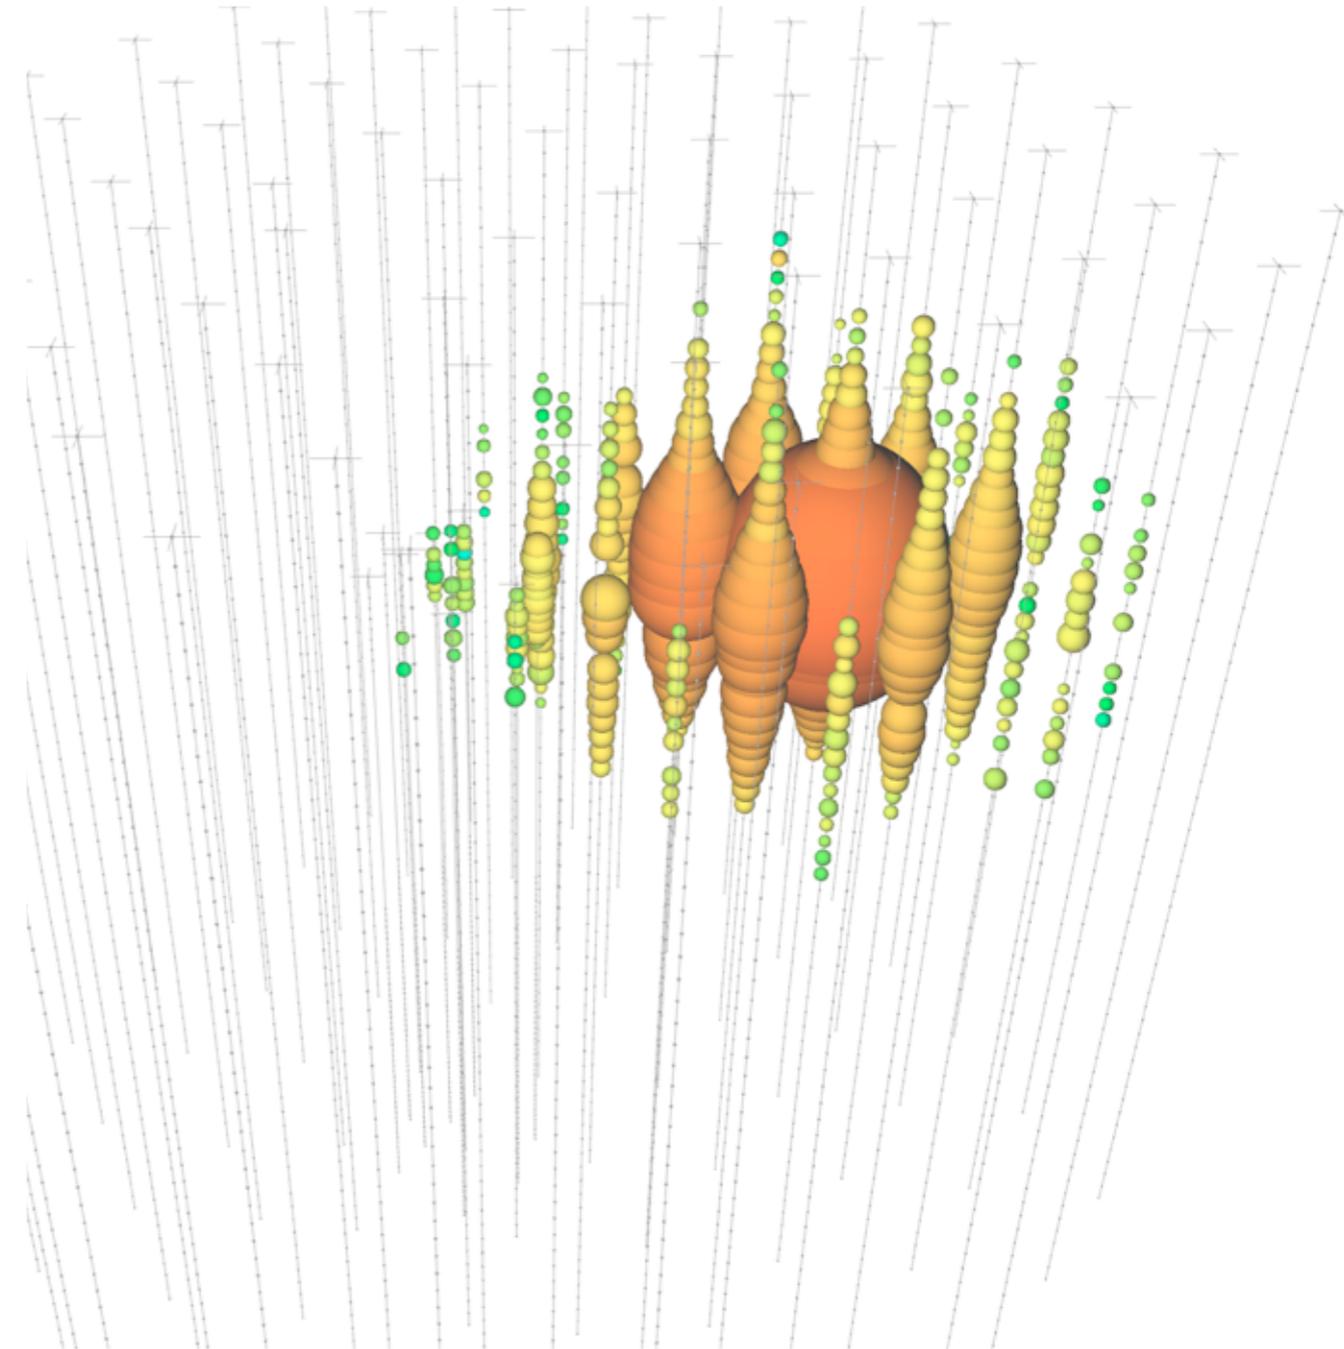

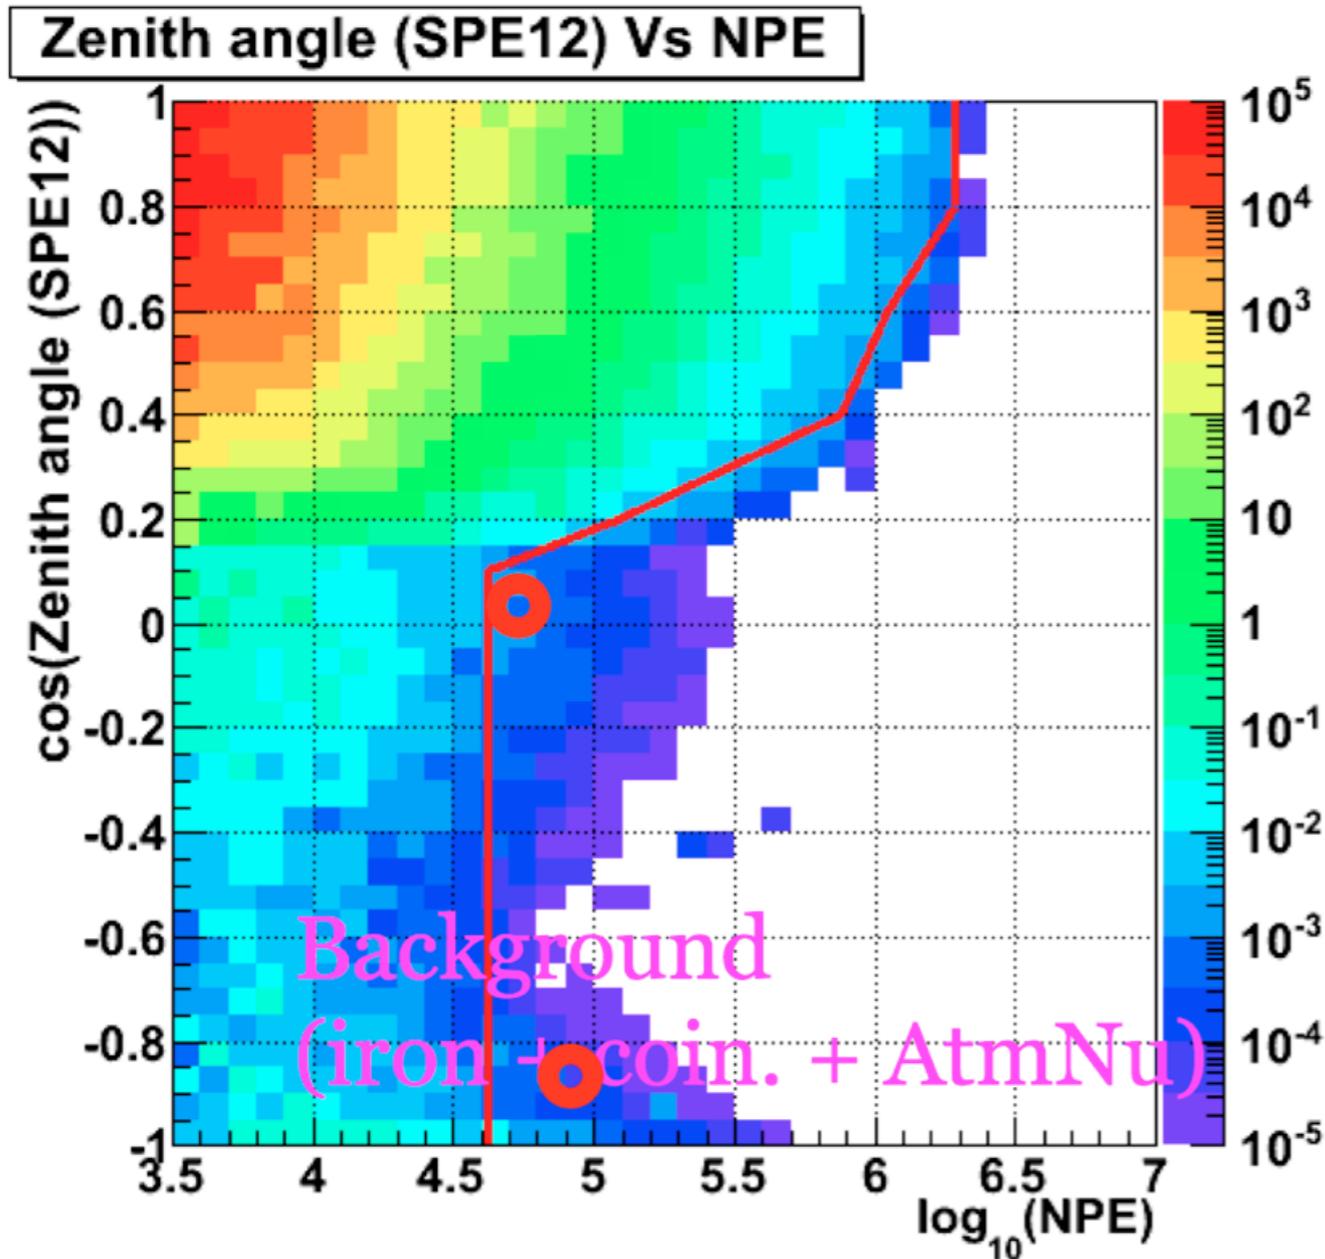

1.04 ± 0.16 PeV

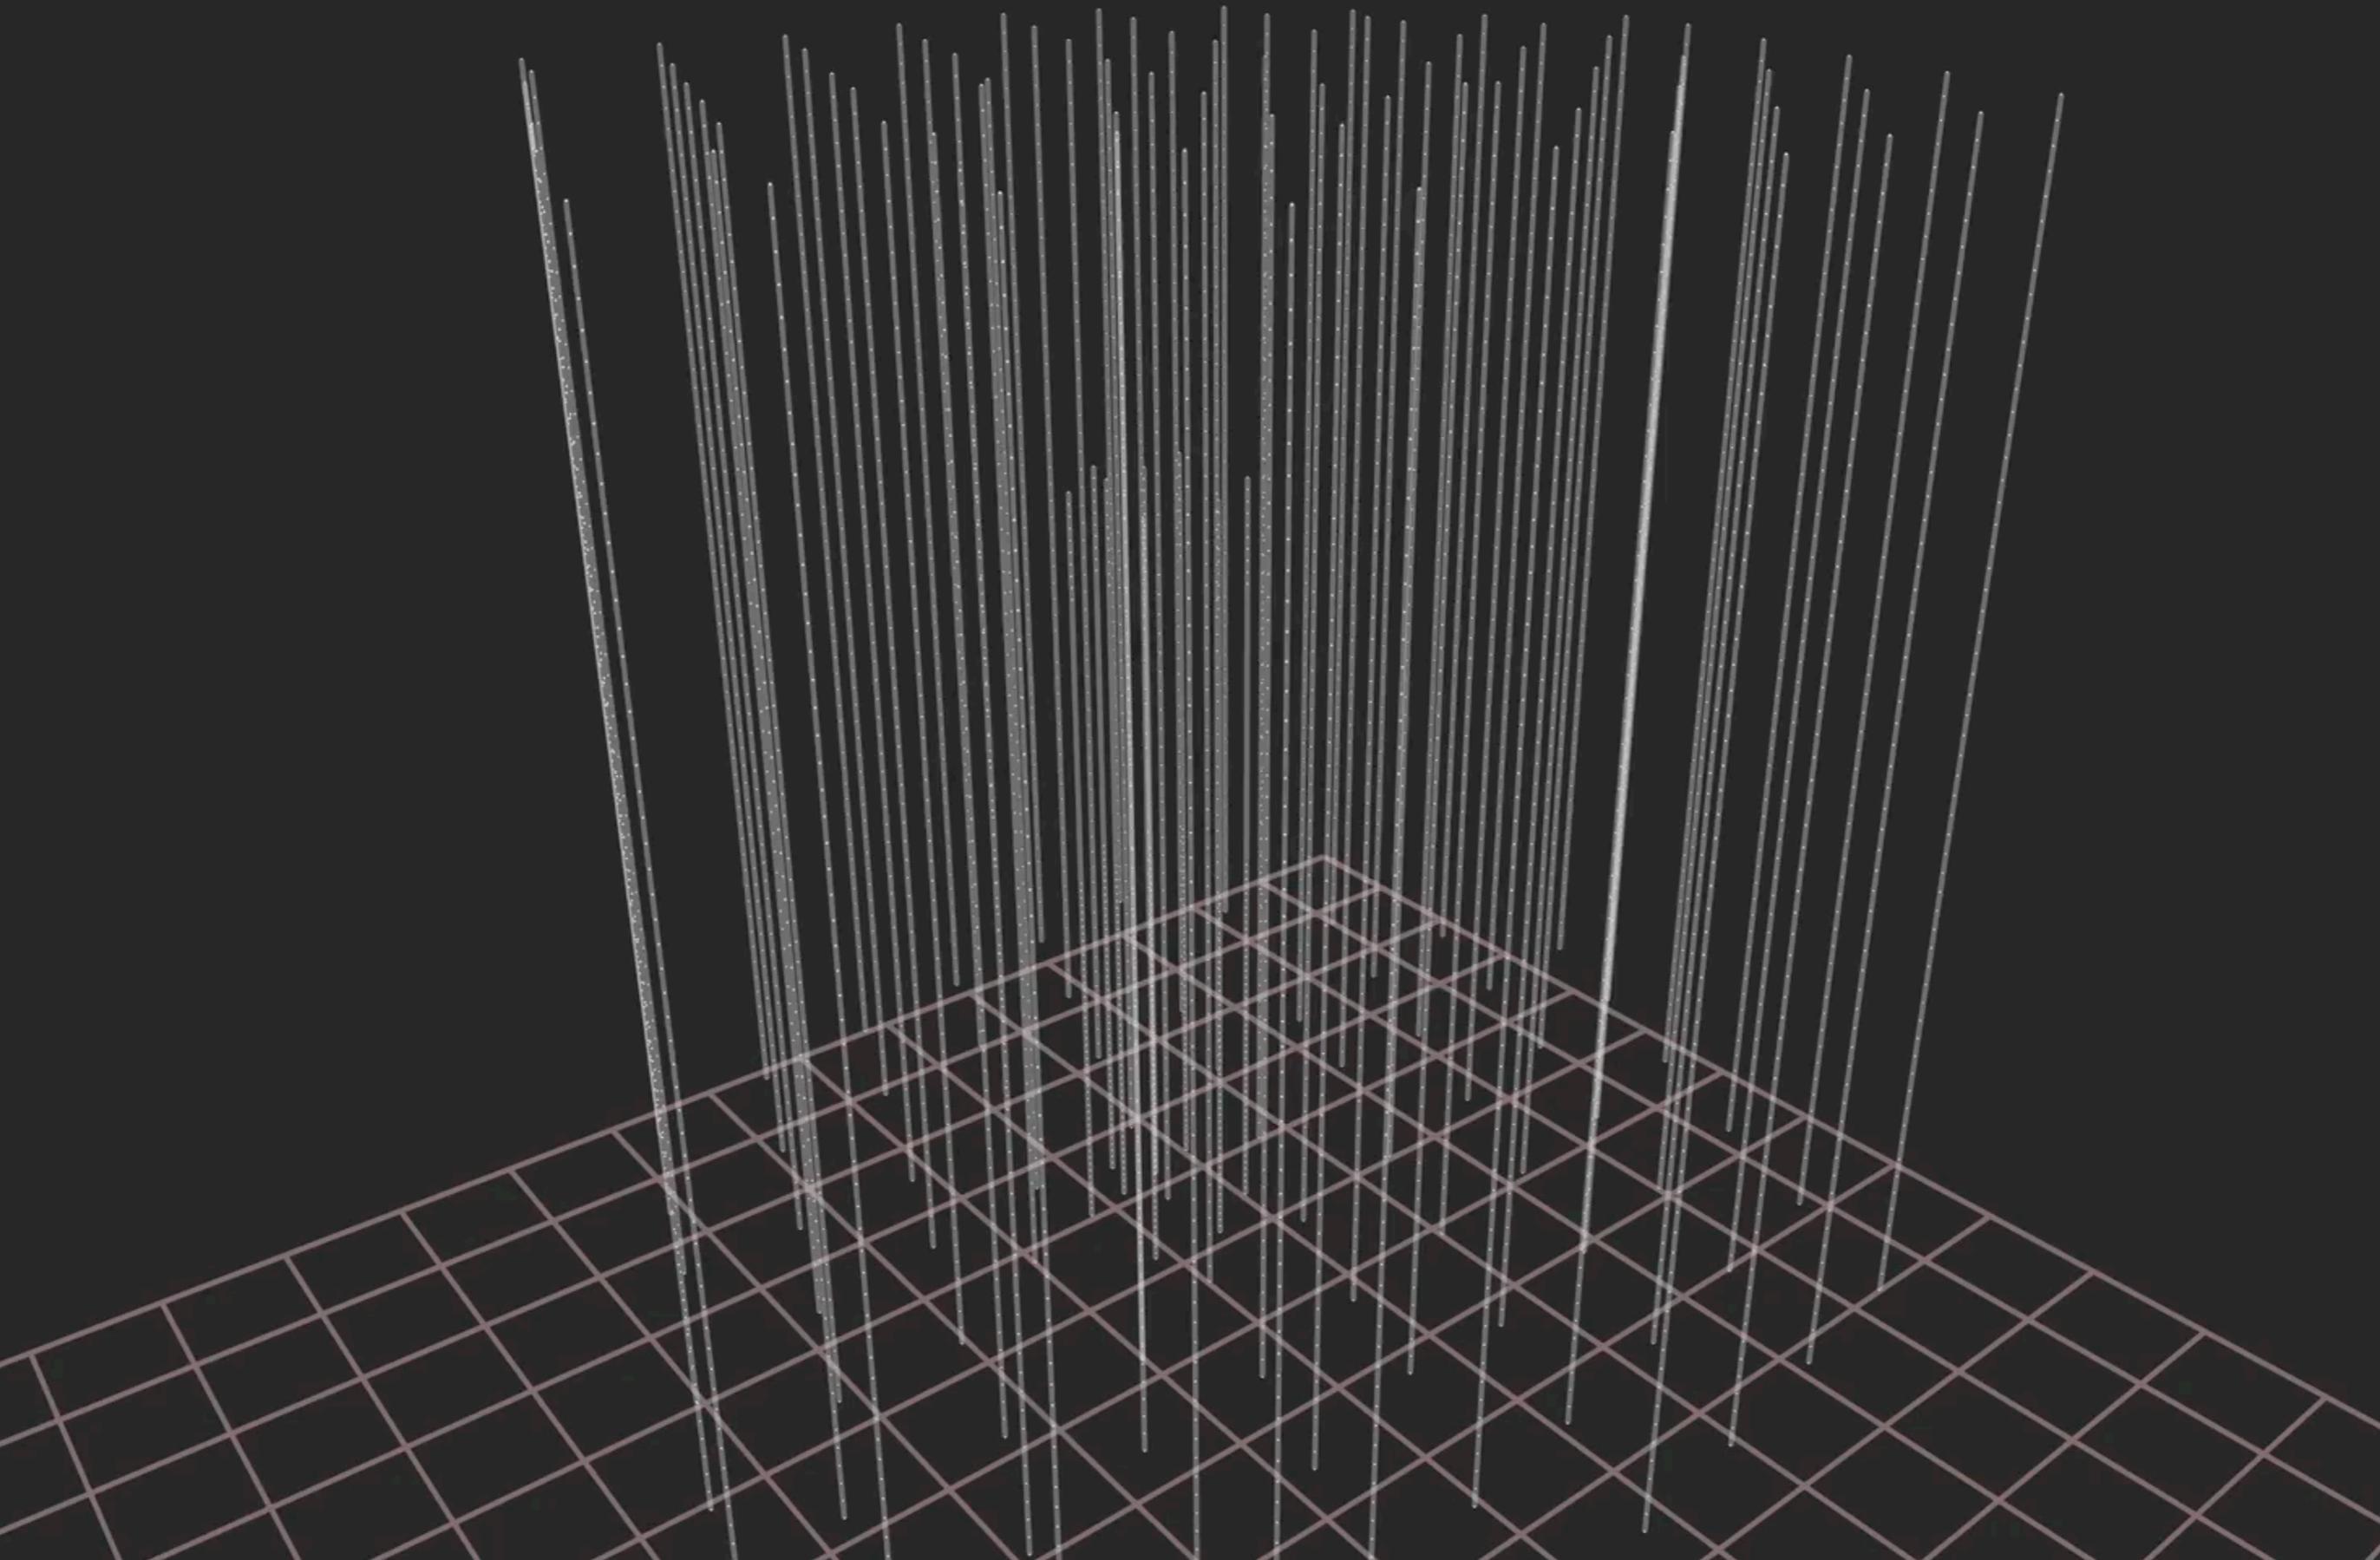

1.14 ± 0.17 PeV

Background Events

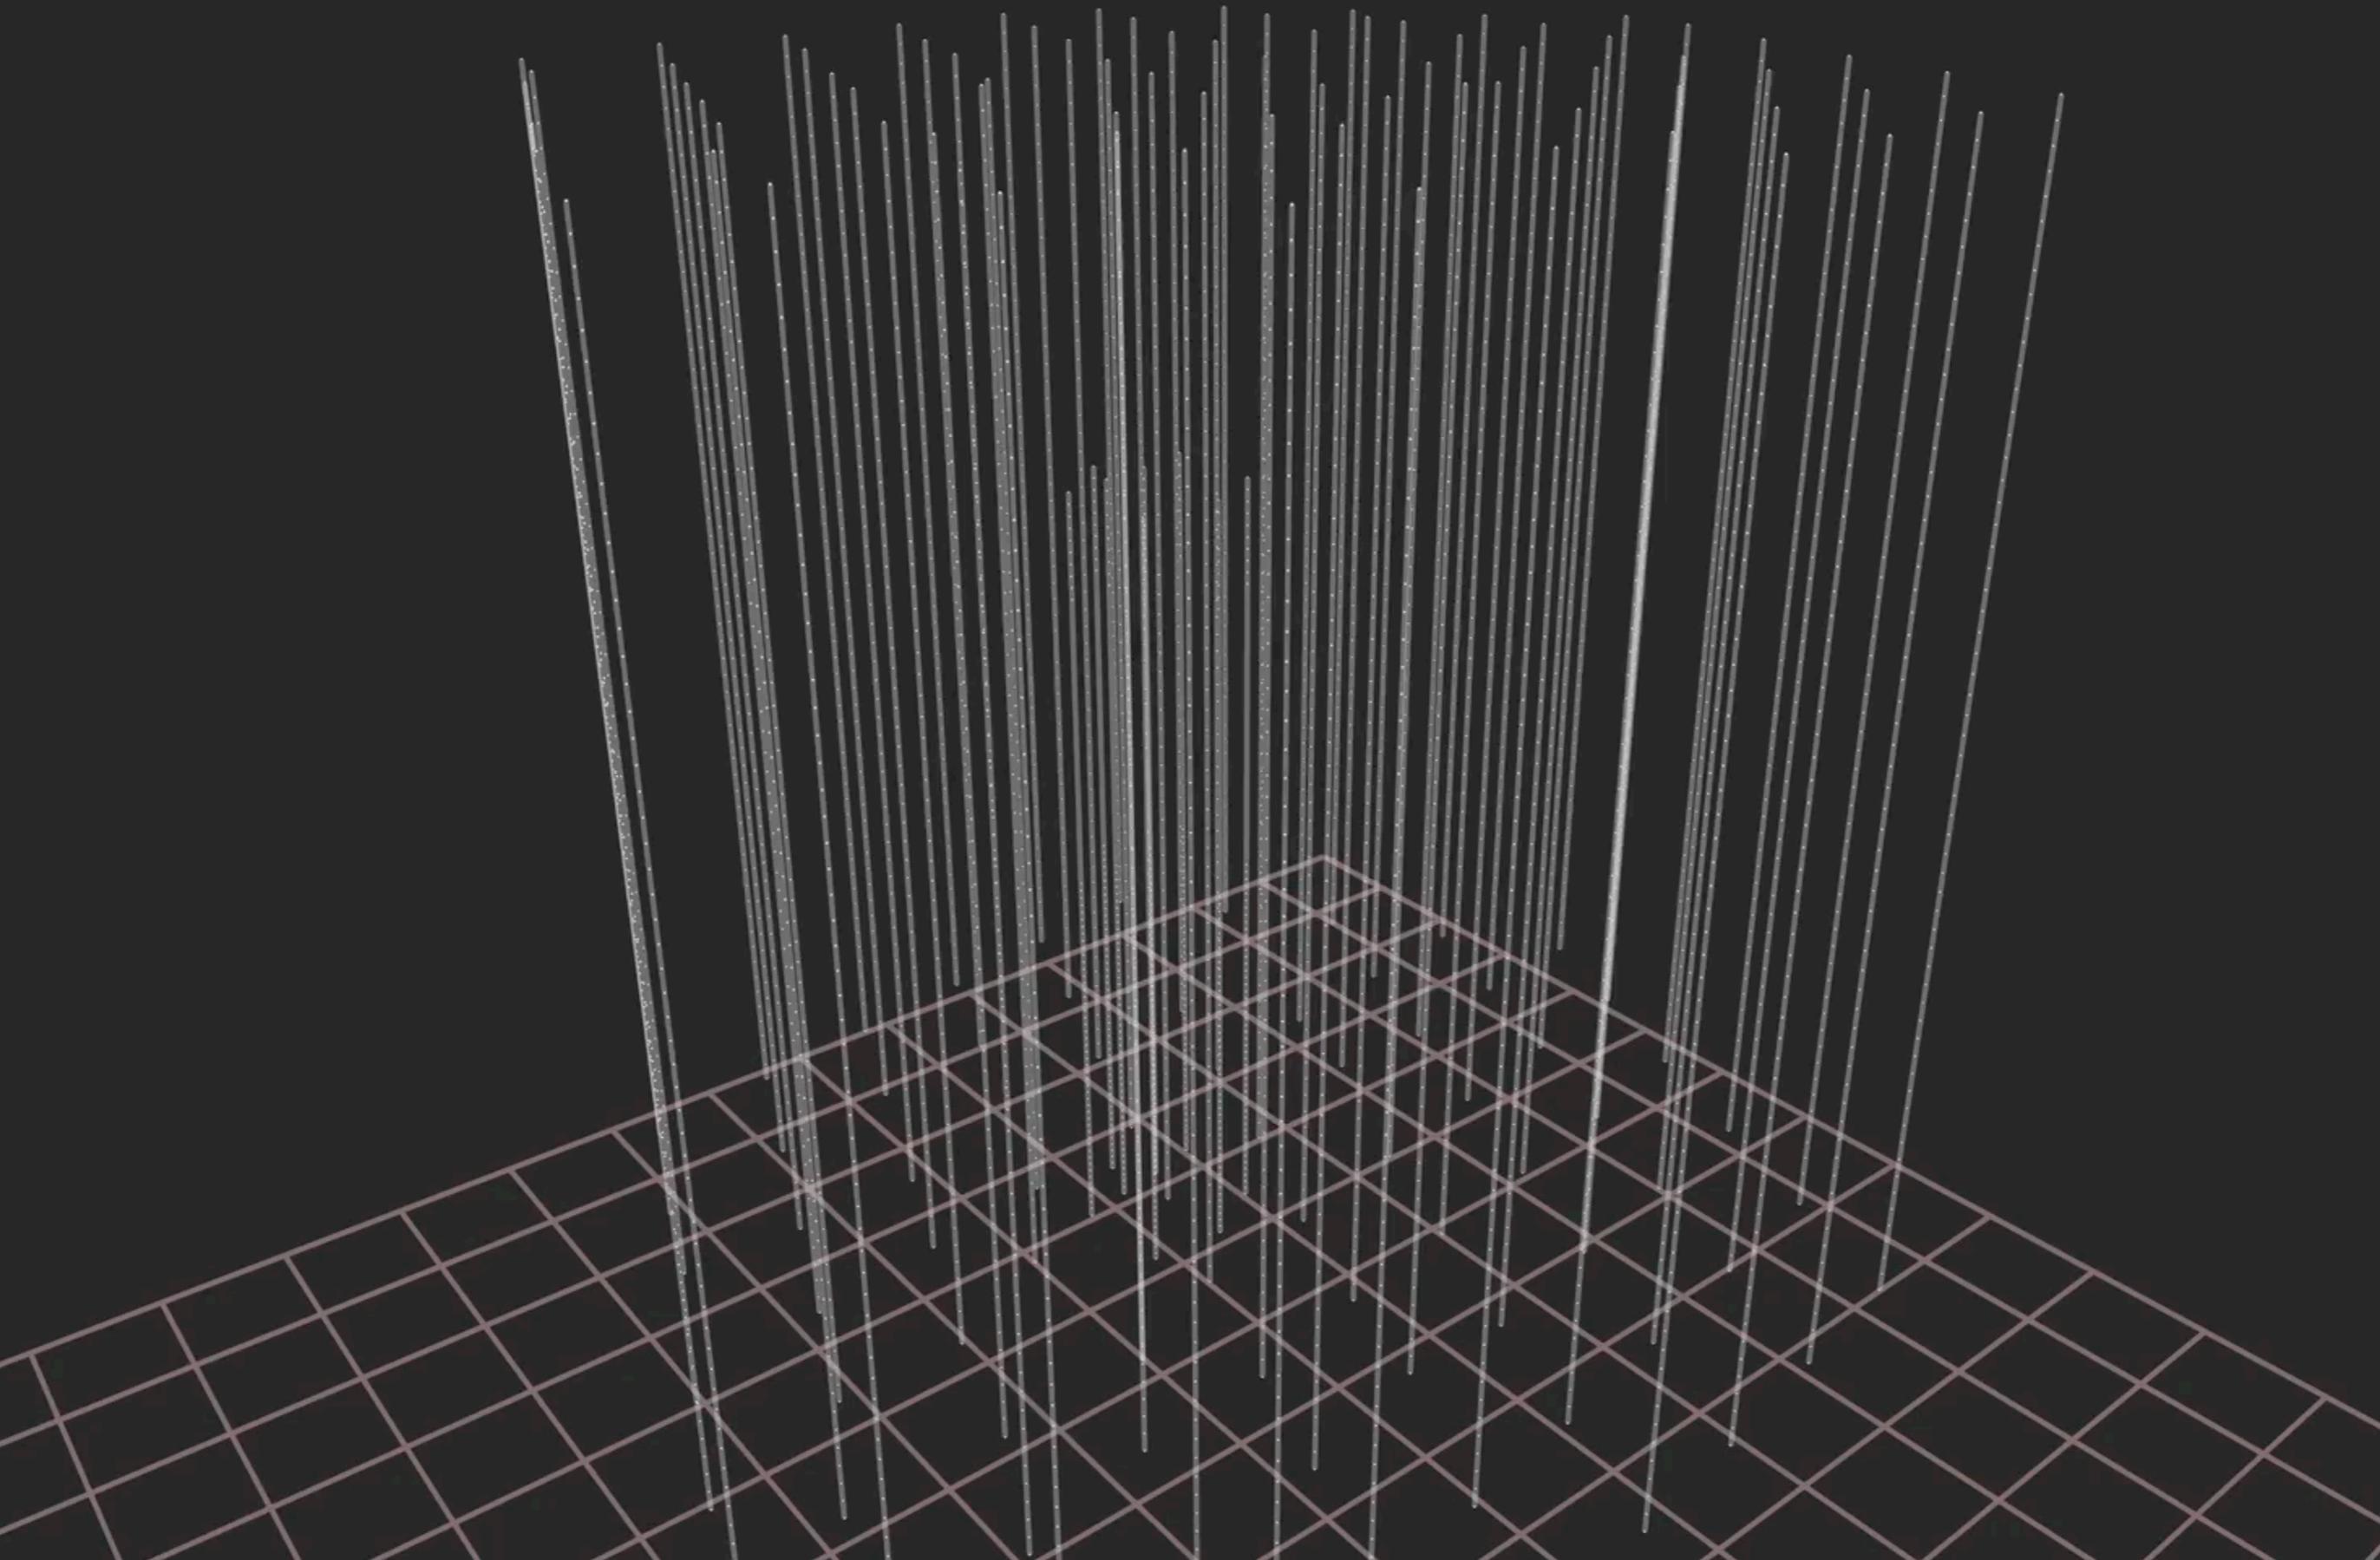

- Fortuitous scenario where the events were mis-reconstructed too high in energy

"Ernie" - 2nd highest energy neutrino ever

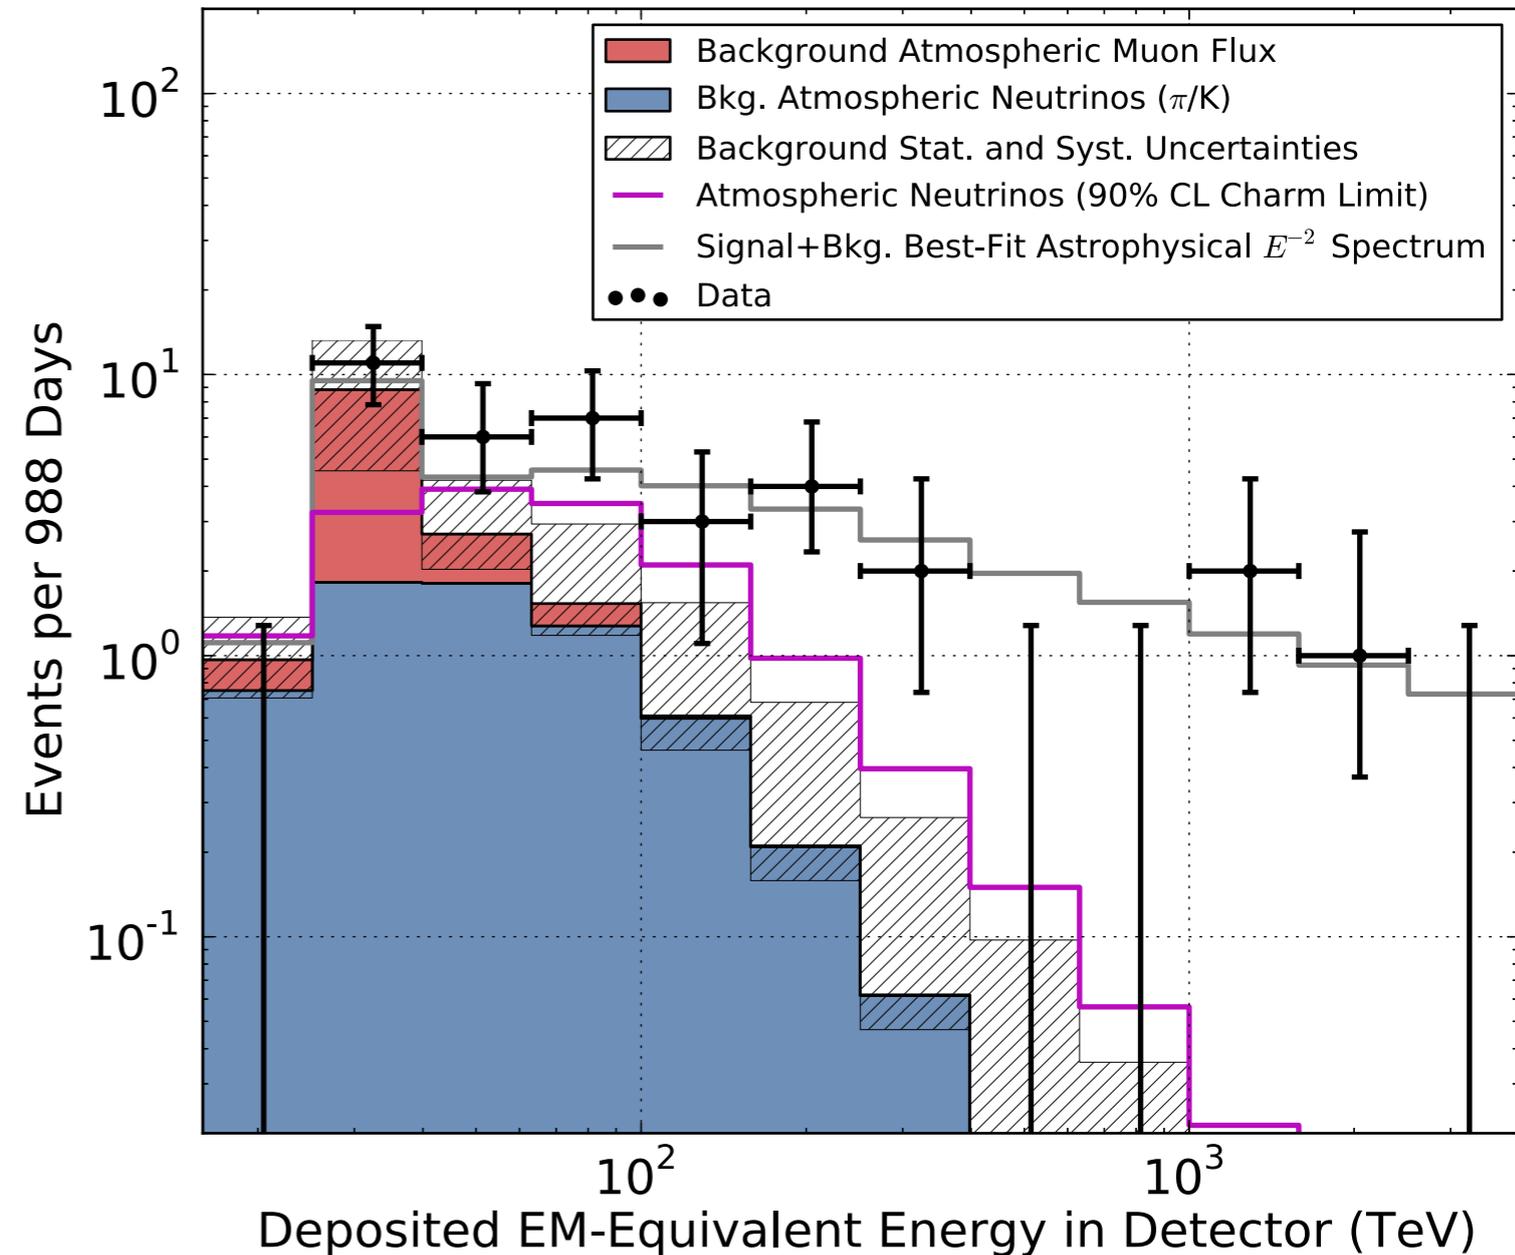

"Ernie" - 2nd highest energy neutrino ever

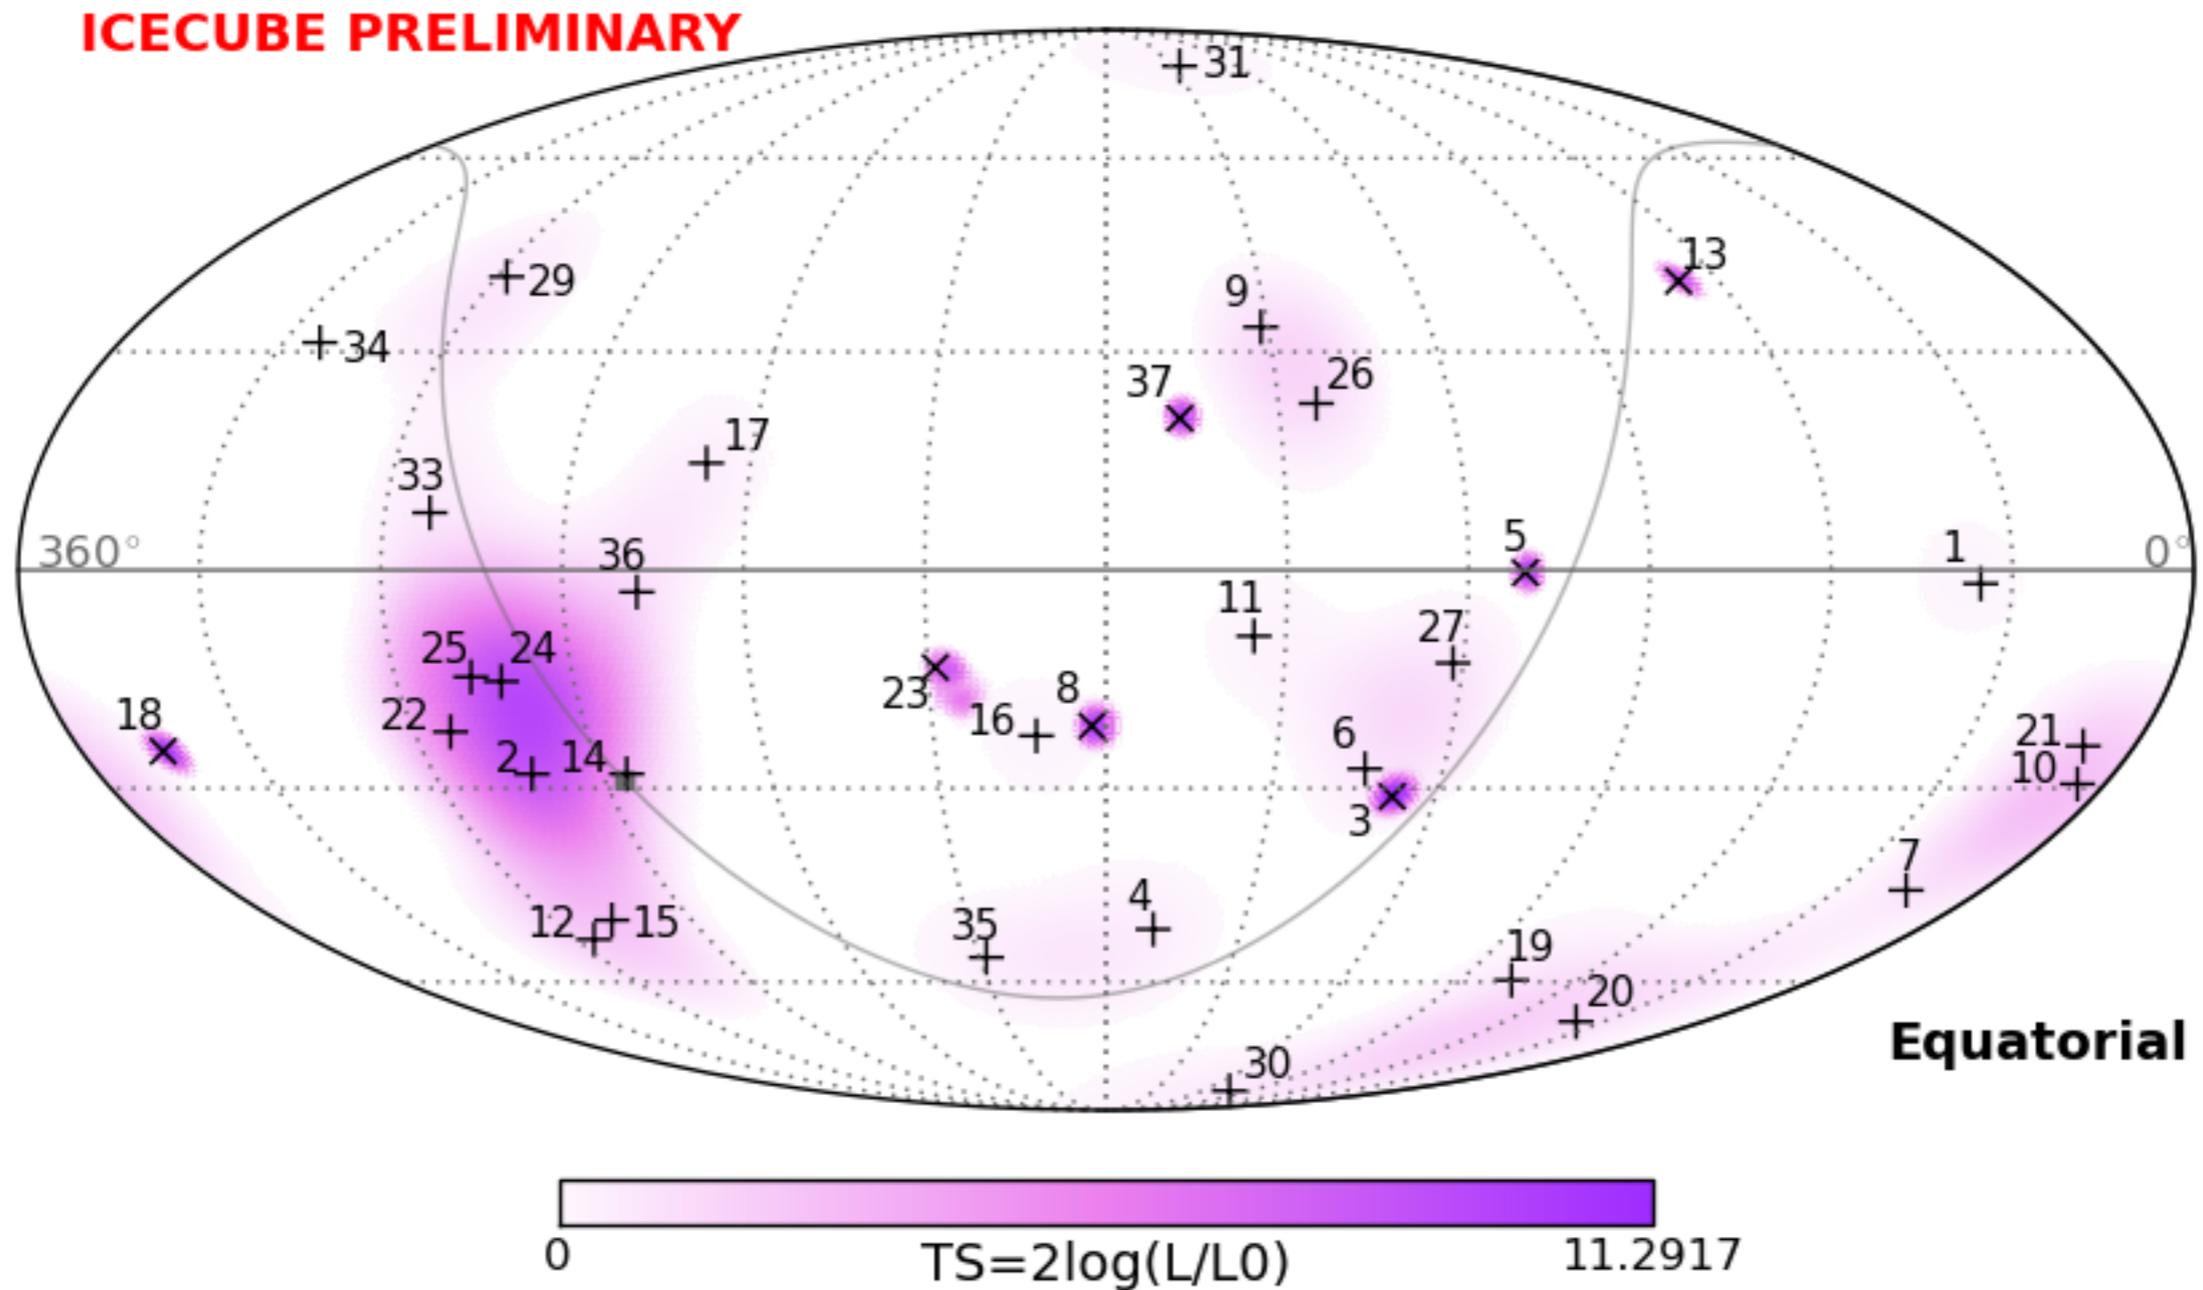

3-year HESSE Result

- 36(+1) events total
 - 8.4 ± 4.2 atm. muons
 - $6.6^{+5.9}_{-1.6}$ atm. neutrinos
- 5.7σ rejection of only atmospheric neutrino flux

HESE-III Sky Map

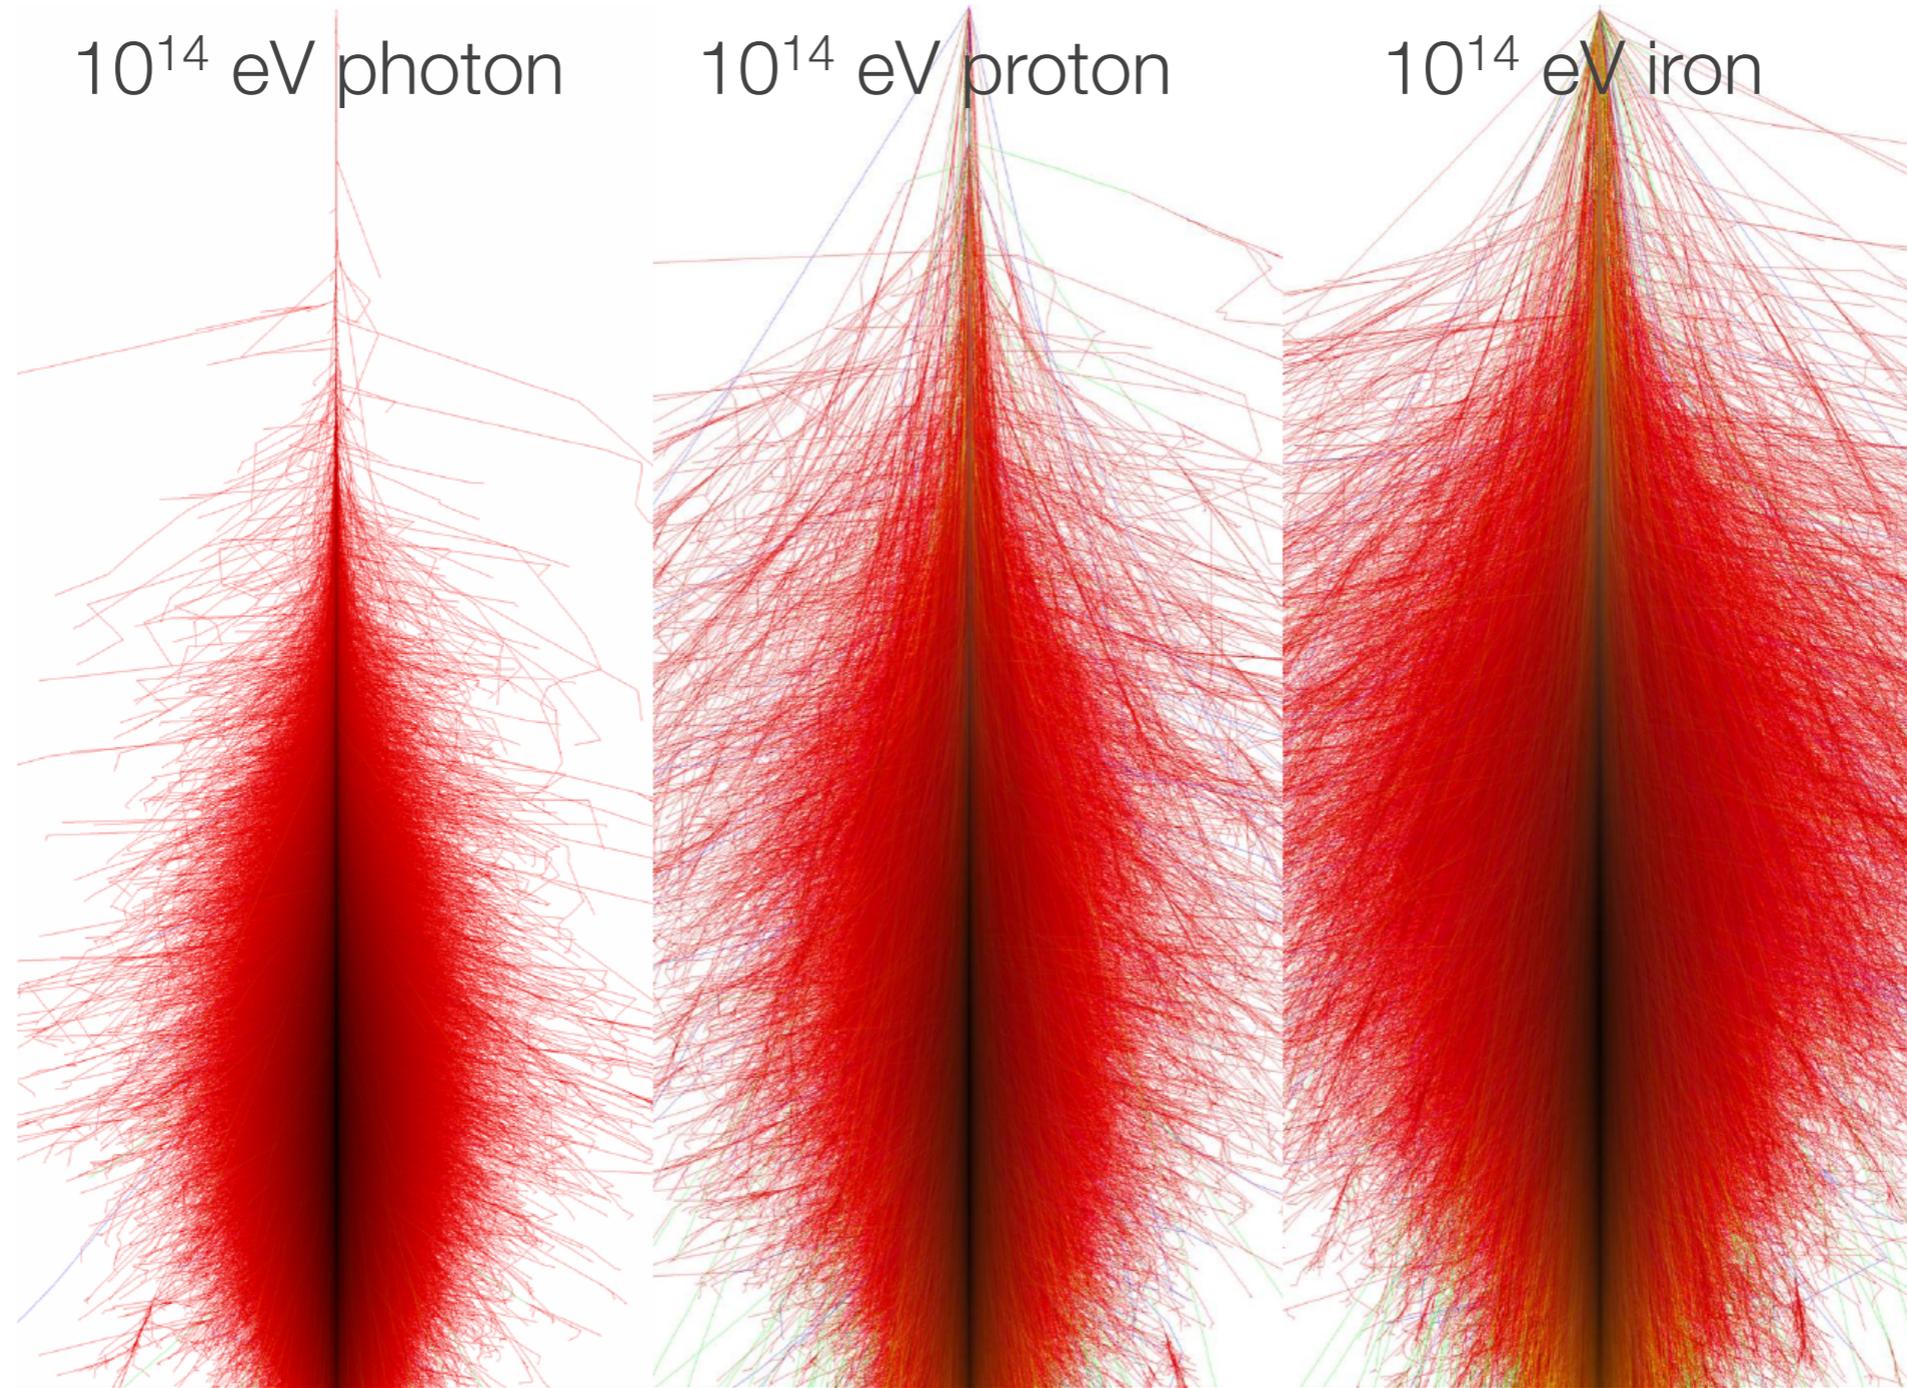

- No significant evidence for clustering

Monte Carlo

- High Energy Starting Event analysis is simple and serendipitous
 - Easy cuts
 - Signal would, and has been, found by dedicated analysis that use more sophisticated methods
- Analysis which found the 2 'background' events
 - Developed on Monte Carlo
 - 2 backgrounds were statistically significant

Background - CORSIKA

Produces neutrinos too

Neutrino

Neutrino

- Running the full CORSIKA simulation is overkill for producing a simulated neutrino sample

Neutrino

- Running the full CORSIKA simulation is overkill for producing a simulated neutrino sample

Neutrino

- Running the full CORSIKA simulation is overkill for producing a simulated neutrino sample
- A solution is to generate neutrino Monte Carlo separately than muon background from CORSIKA

Neutrino

- Running the full CORSIKA simulation is overkill for producing a simulated neutrino sample
- A solution is to generate neutrino Monte Carlo separately than muon background from CORSIKA
 - Atmospheric and predicted astrophysical neutrino fluxes follow a power law in energy, e.g. $\Phi_\nu \propto E_\nu^{-\gamma}$

Neutrino

- Running the full CORSIKA simulation is overkill for producing a simulated neutrino sample
- A solution is to generate neutrino Monte Carlo separately than muon background from CORSIKA
 - Atmospheric and predicted astrophysical neutrino fluxes follow a power law in energy, e.g. $\Phi_\nu \propto E_\nu^{-\gamma}$
 - Specific energy regions are more important than others

Neutrino

Gamma Ray Bursts

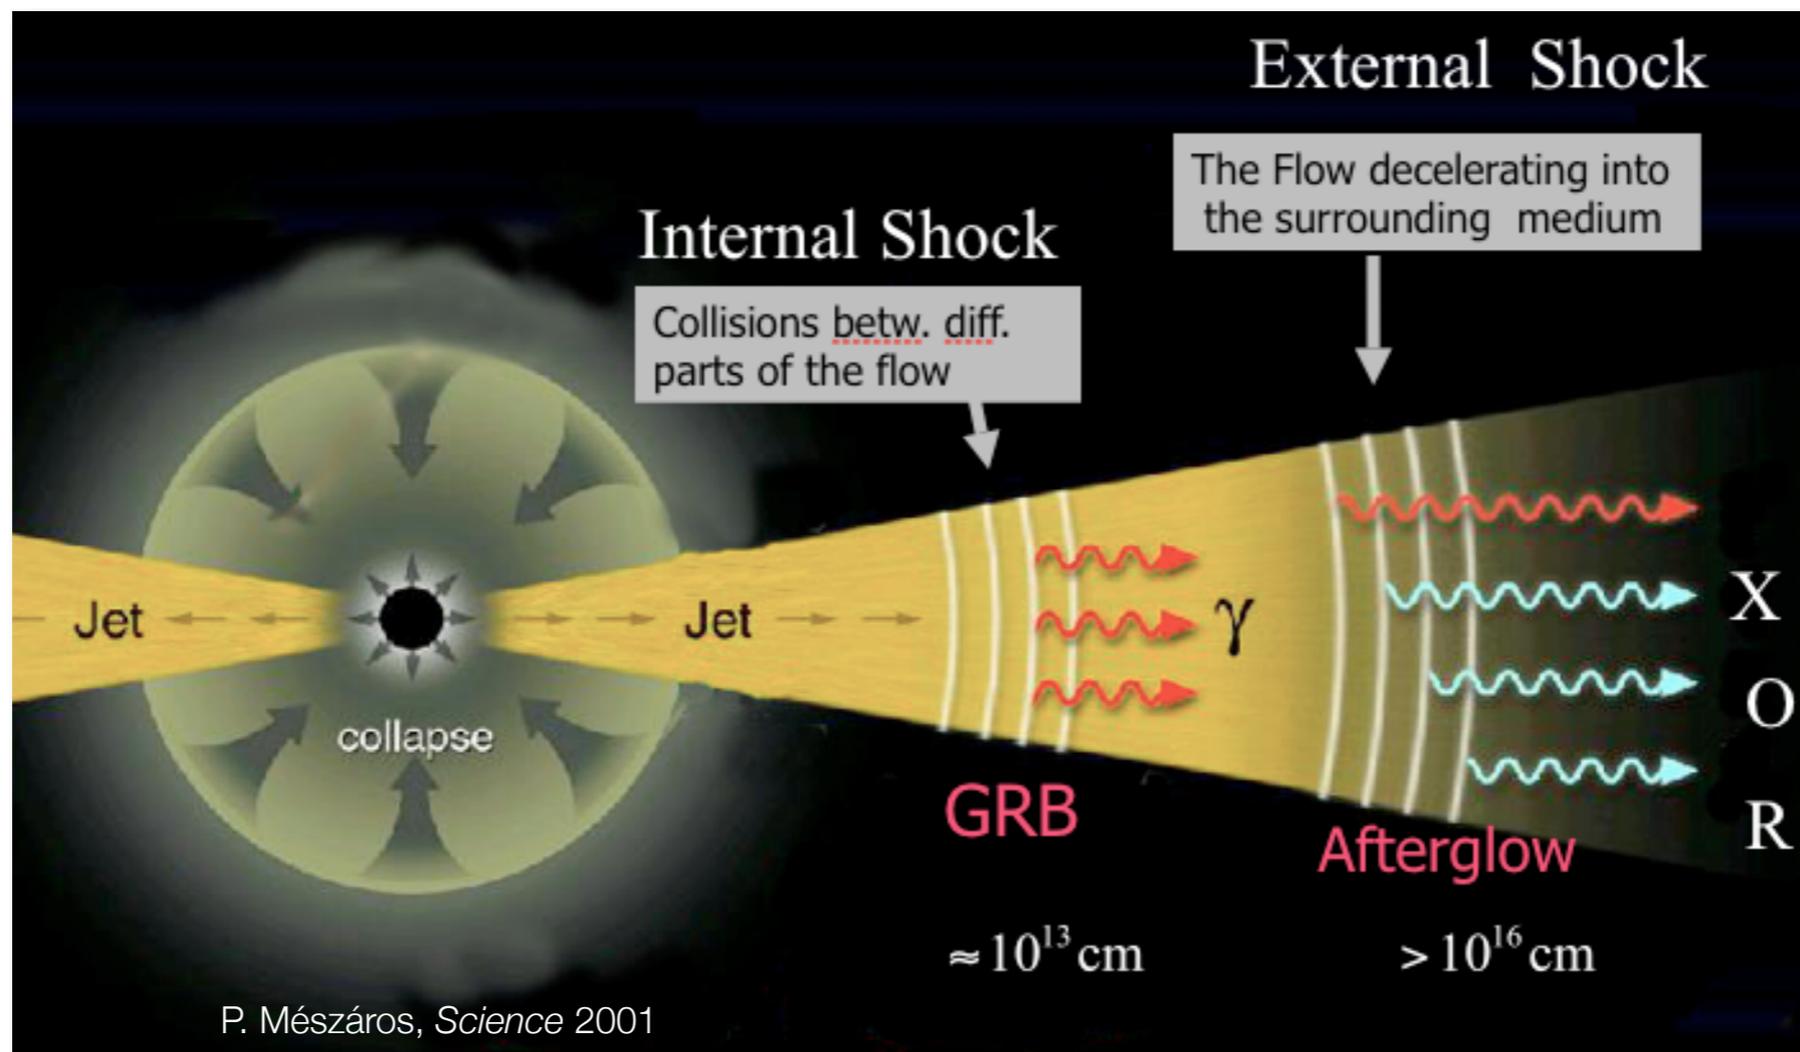

Gamma Ray Bursts

- Gamma-ray satellites identify time and location of GRB

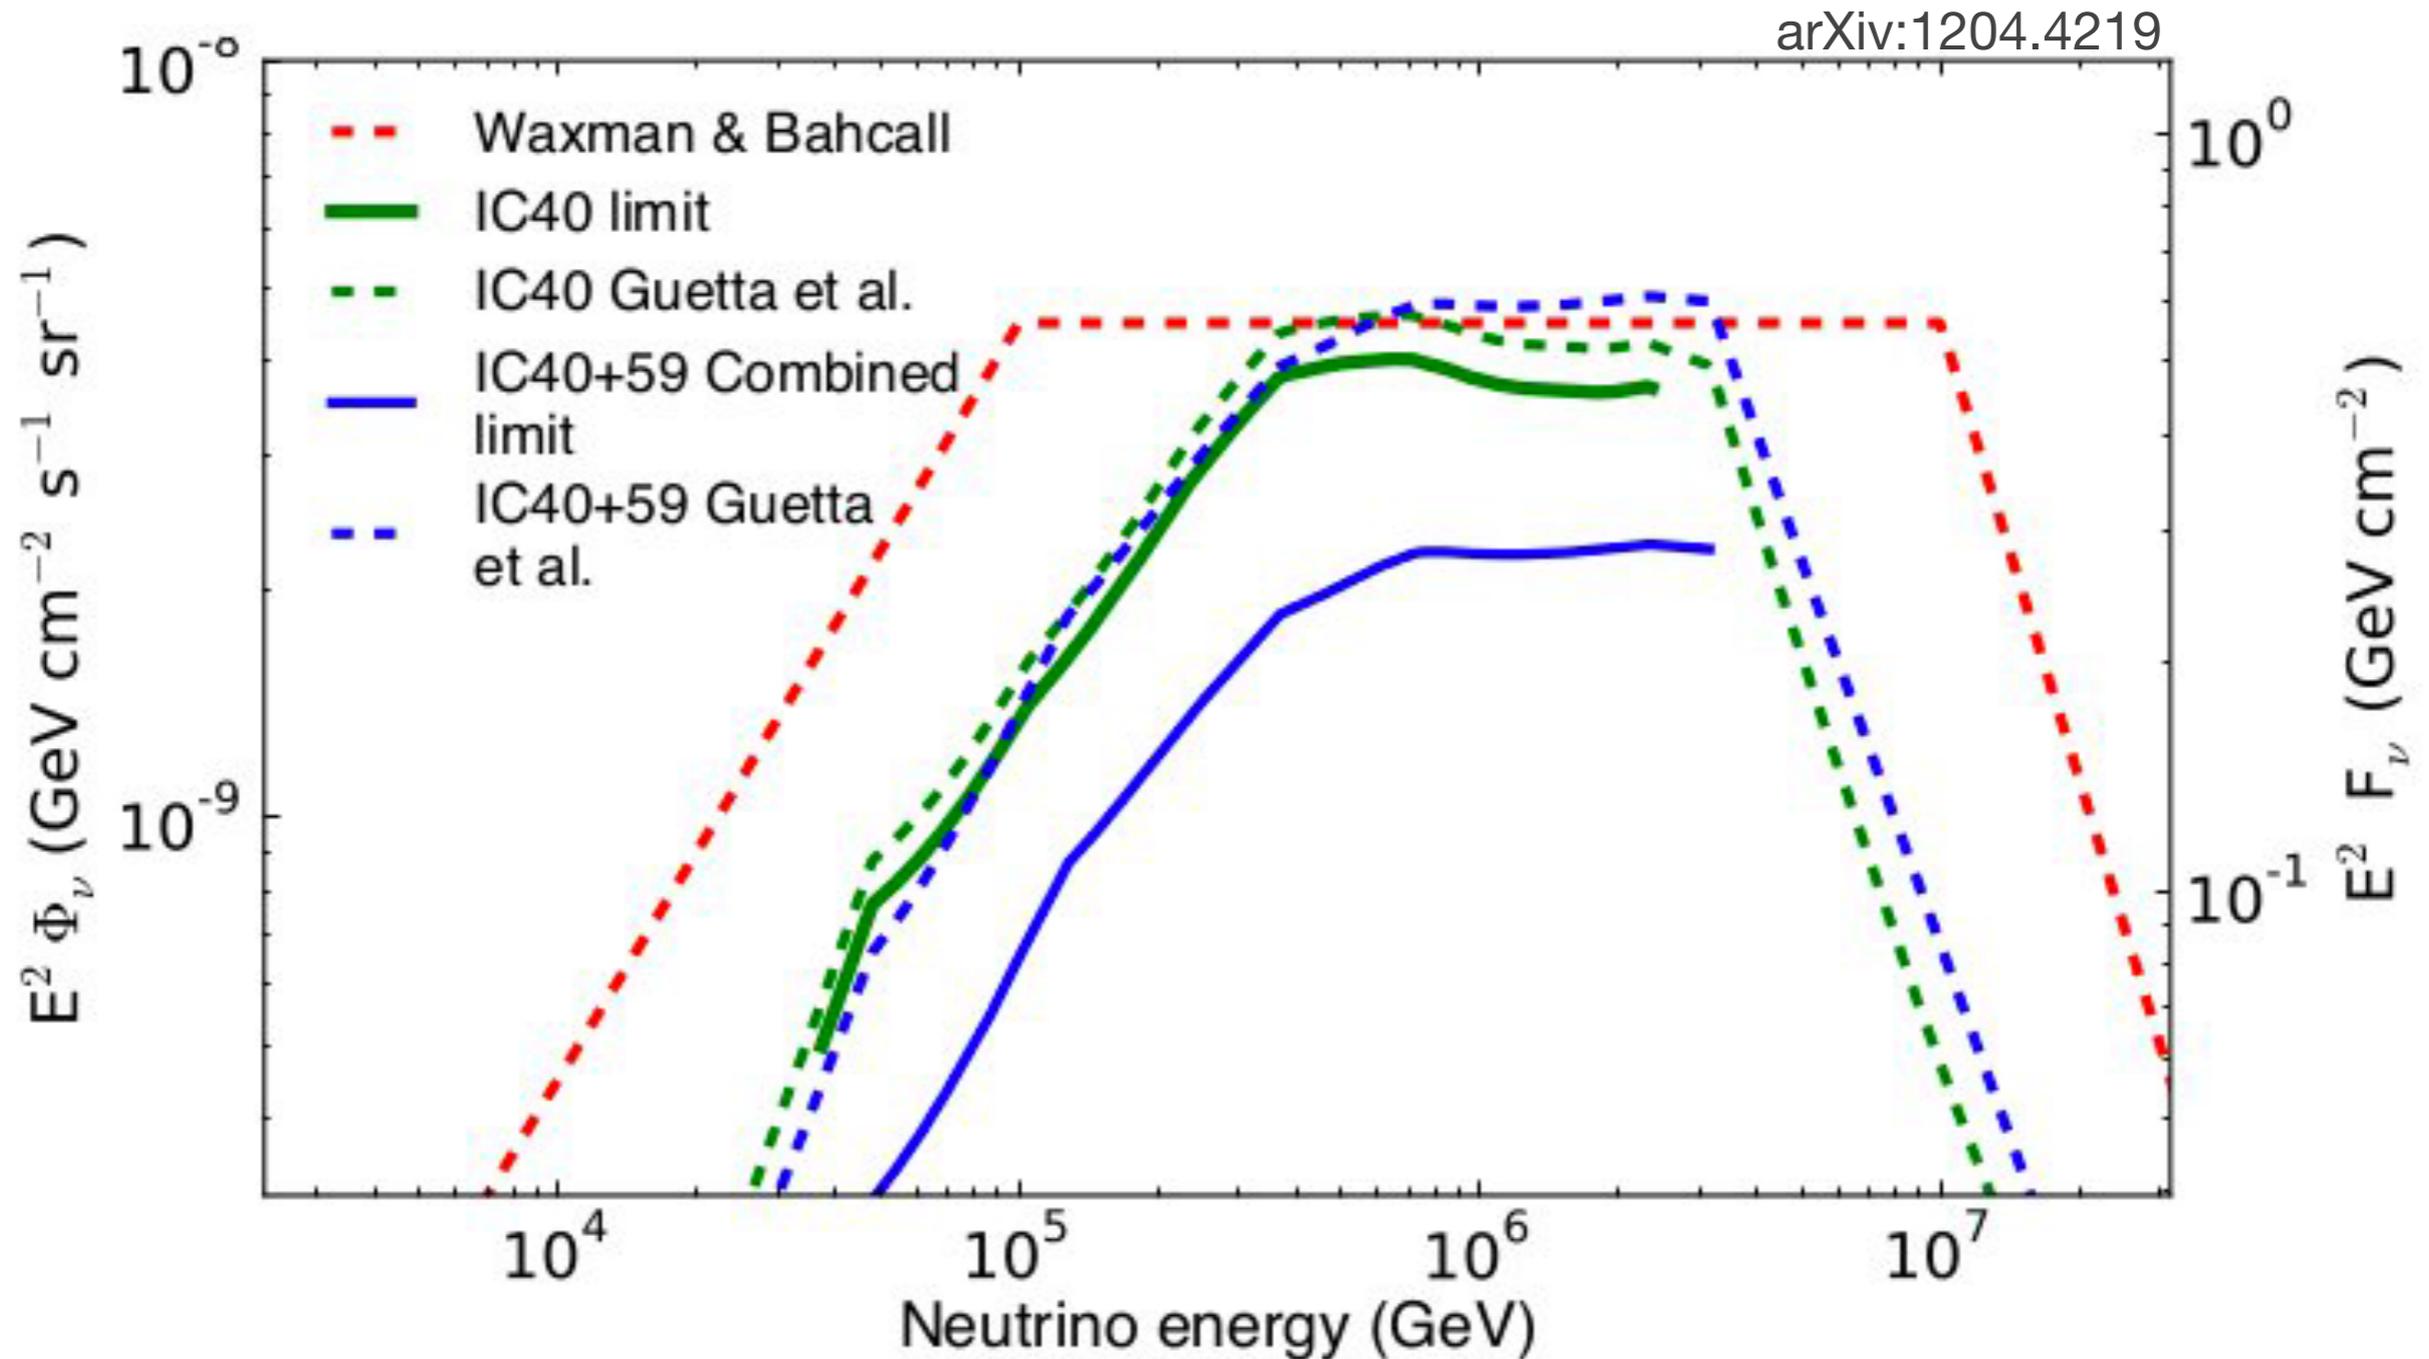

Gamma Ray Bursts

- Gamma-ray satellites identify time and location of GRB
- Search for neutrinos produced by $p+\gamma$ interactions
 1. Fireball GRB models, i.e. gamma-rays produced from high temperature plasma
 2. Model Independent

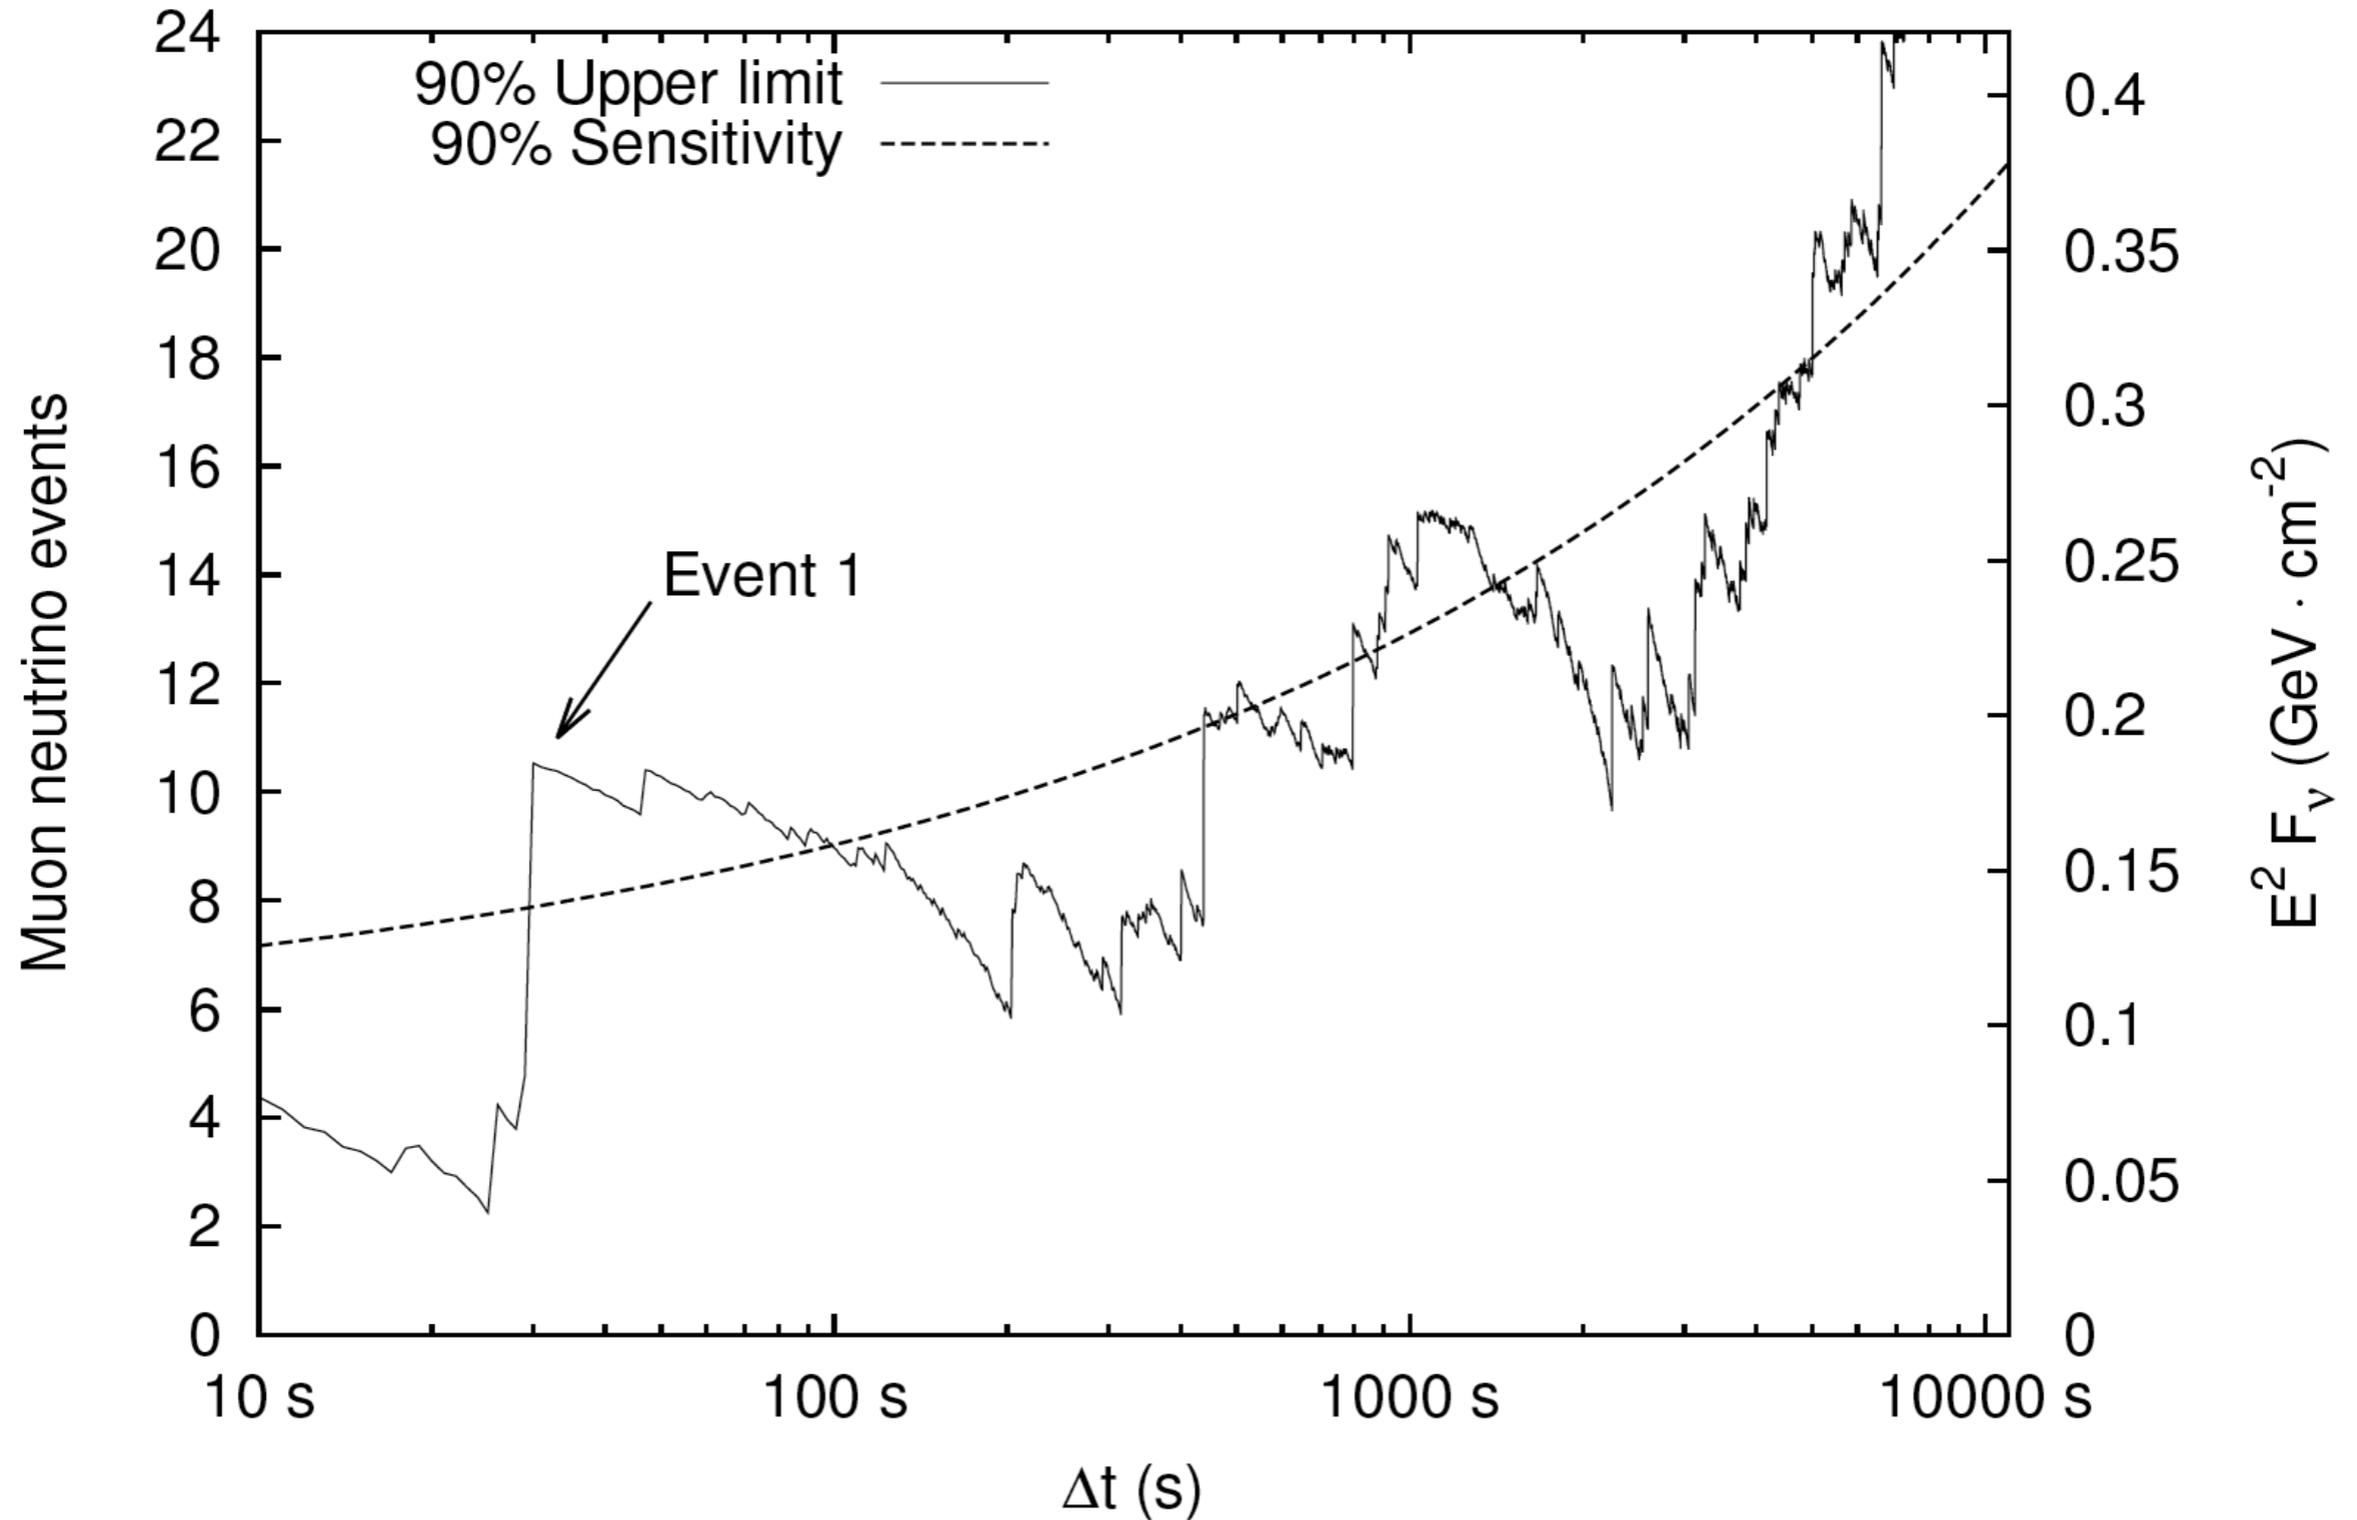

GRB Fireball Model

- Data provides an upper limit that is 3.7x lower than fireball prediction
- Model independent search also shows no events associated with GRBs

Model Independent

GZK Reminder

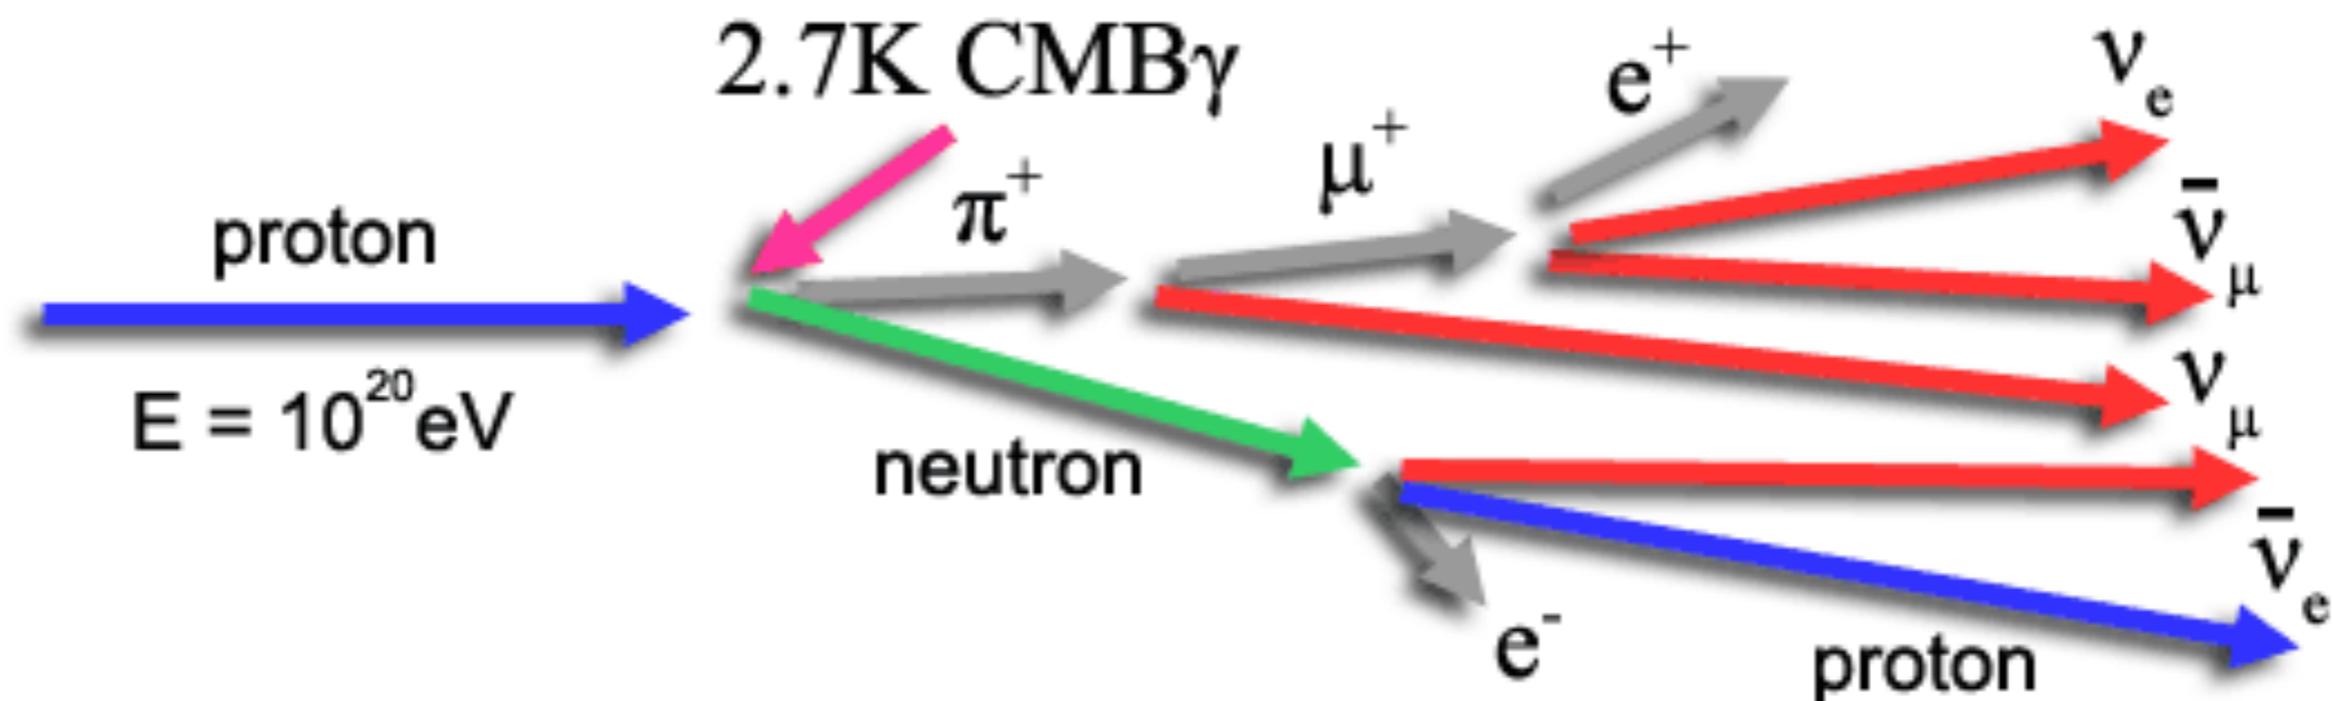

GZK Reminder

- Neutrinos break high energy cosmic ray degeneracy in why no high energy cosmic rays are detected:

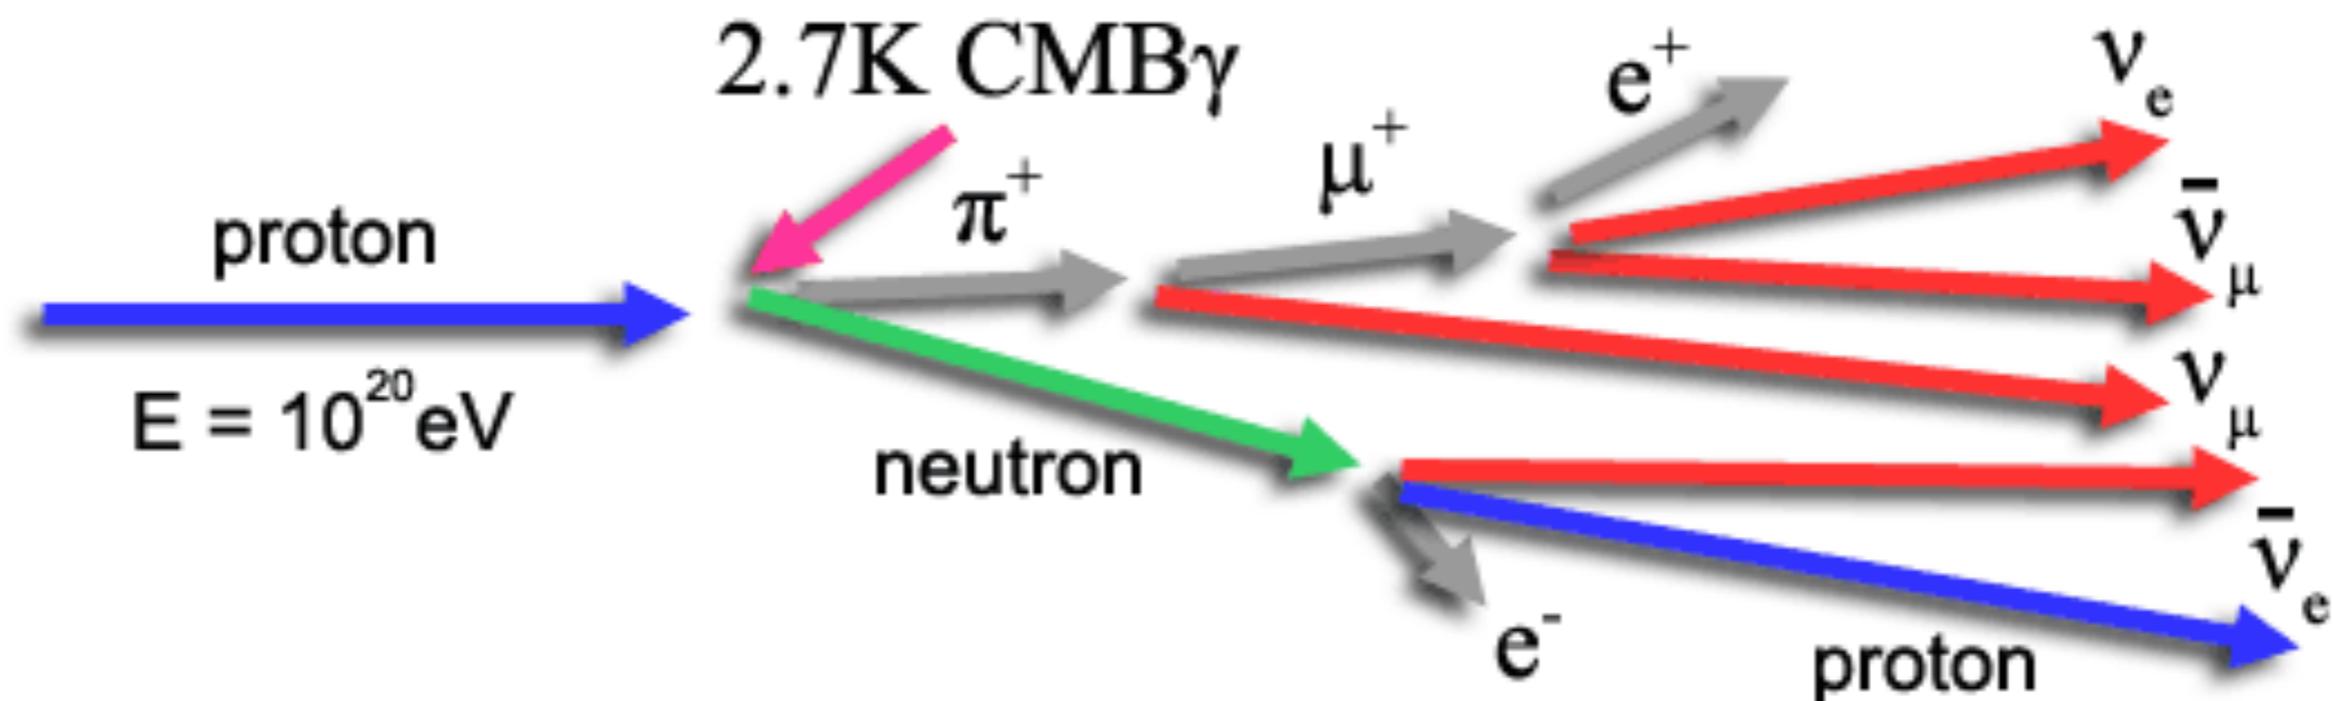

GZK Reminder

- Neutrinos break high energy cosmic ray degeneracy in why no high energy cosmic rays are detected:
 1. Cosmic ray accelerators do **NOT** produce particles at 5×10^{19} eV, i.e. no observation of neutrinos near 5×10^{19} eV

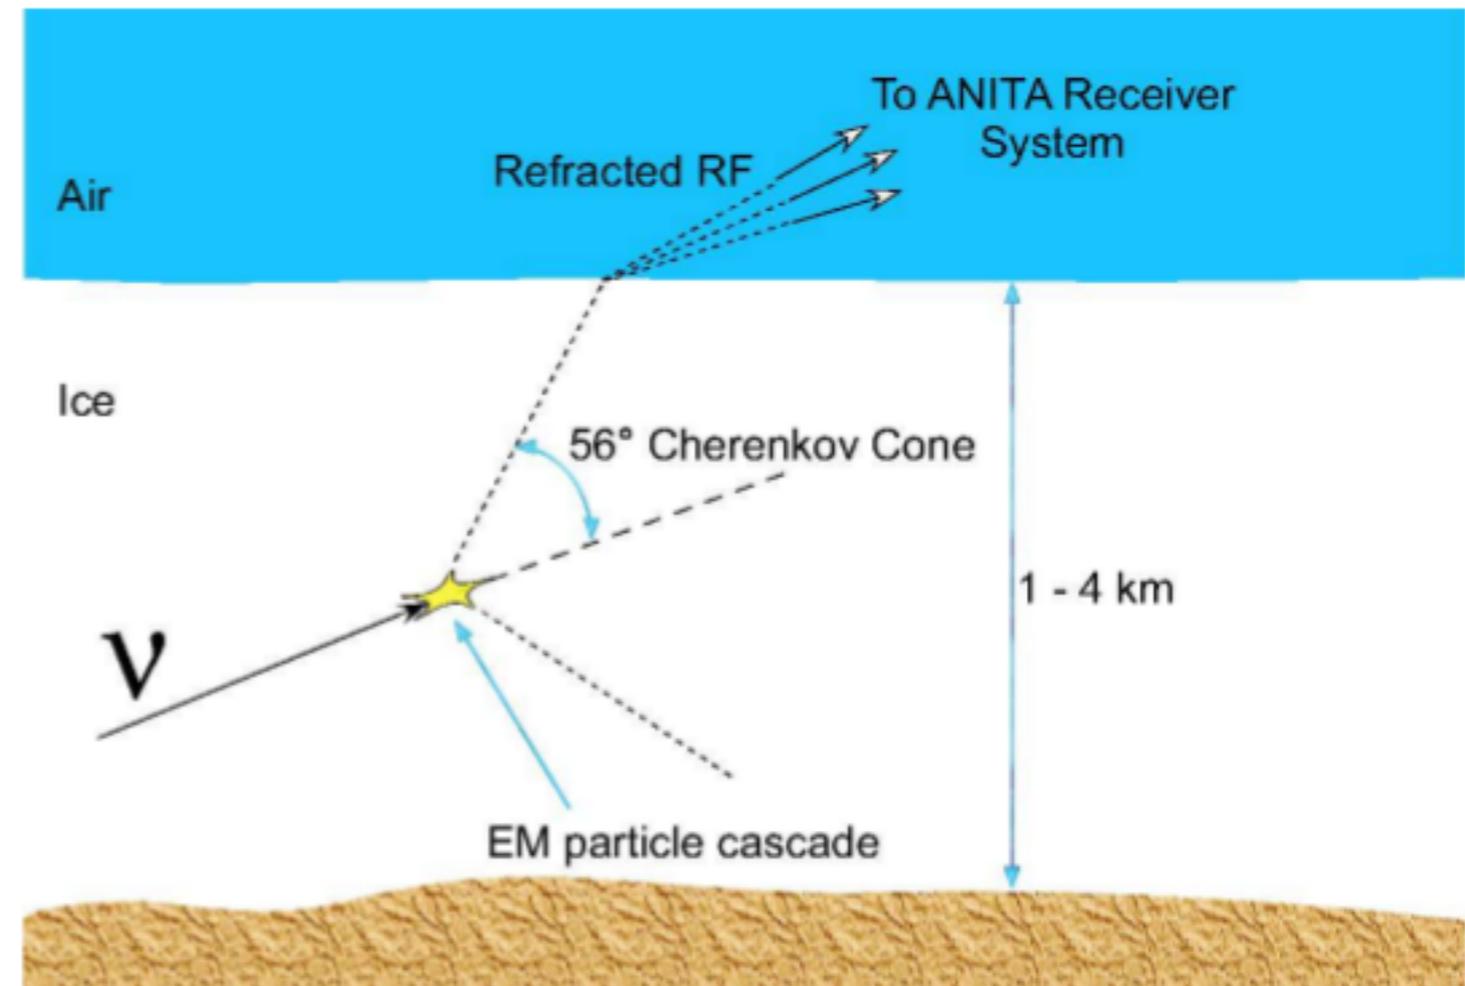

GZK Reminder

- Neutrinos break high energy cosmic ray degeneracy in why no high energy cosmic rays are detected:
 1. Cosmic ray accelerators do **NOT** produce particles at 5×10^{19} eV, i.e. no observation of neutrinos near 5×10^{19} eV
 2. Cosmic ray accelerators **DO** produce particles at 5×10^{19} eV, i.e. positive observation of neutrinos near 5×10^{19} eV

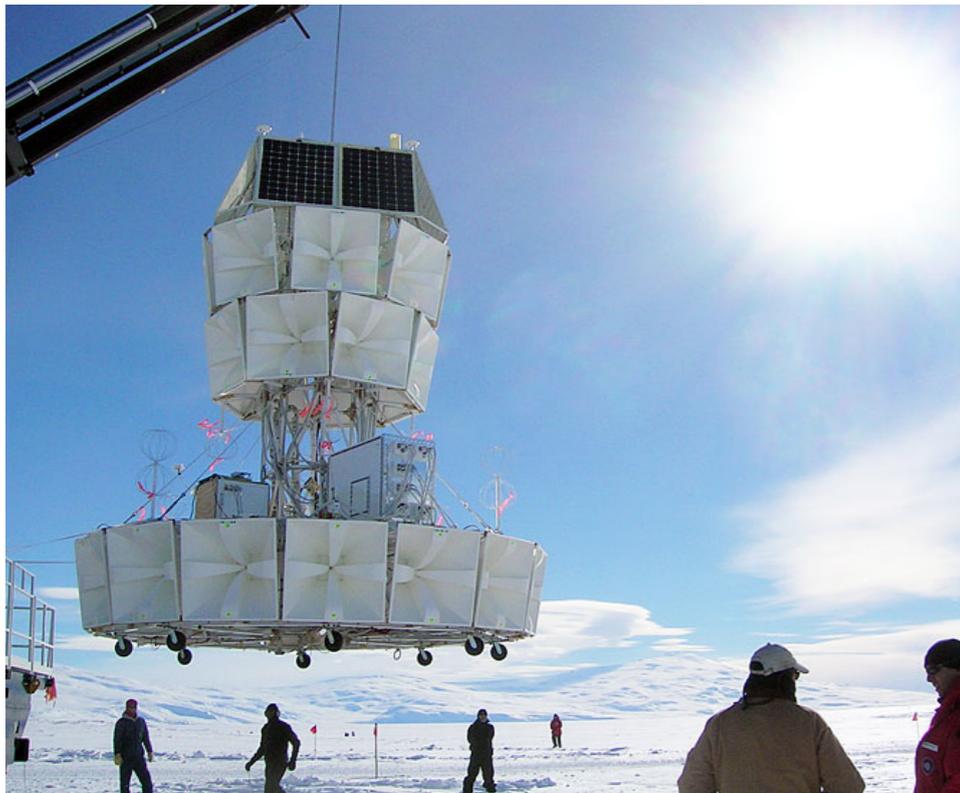

ANITA

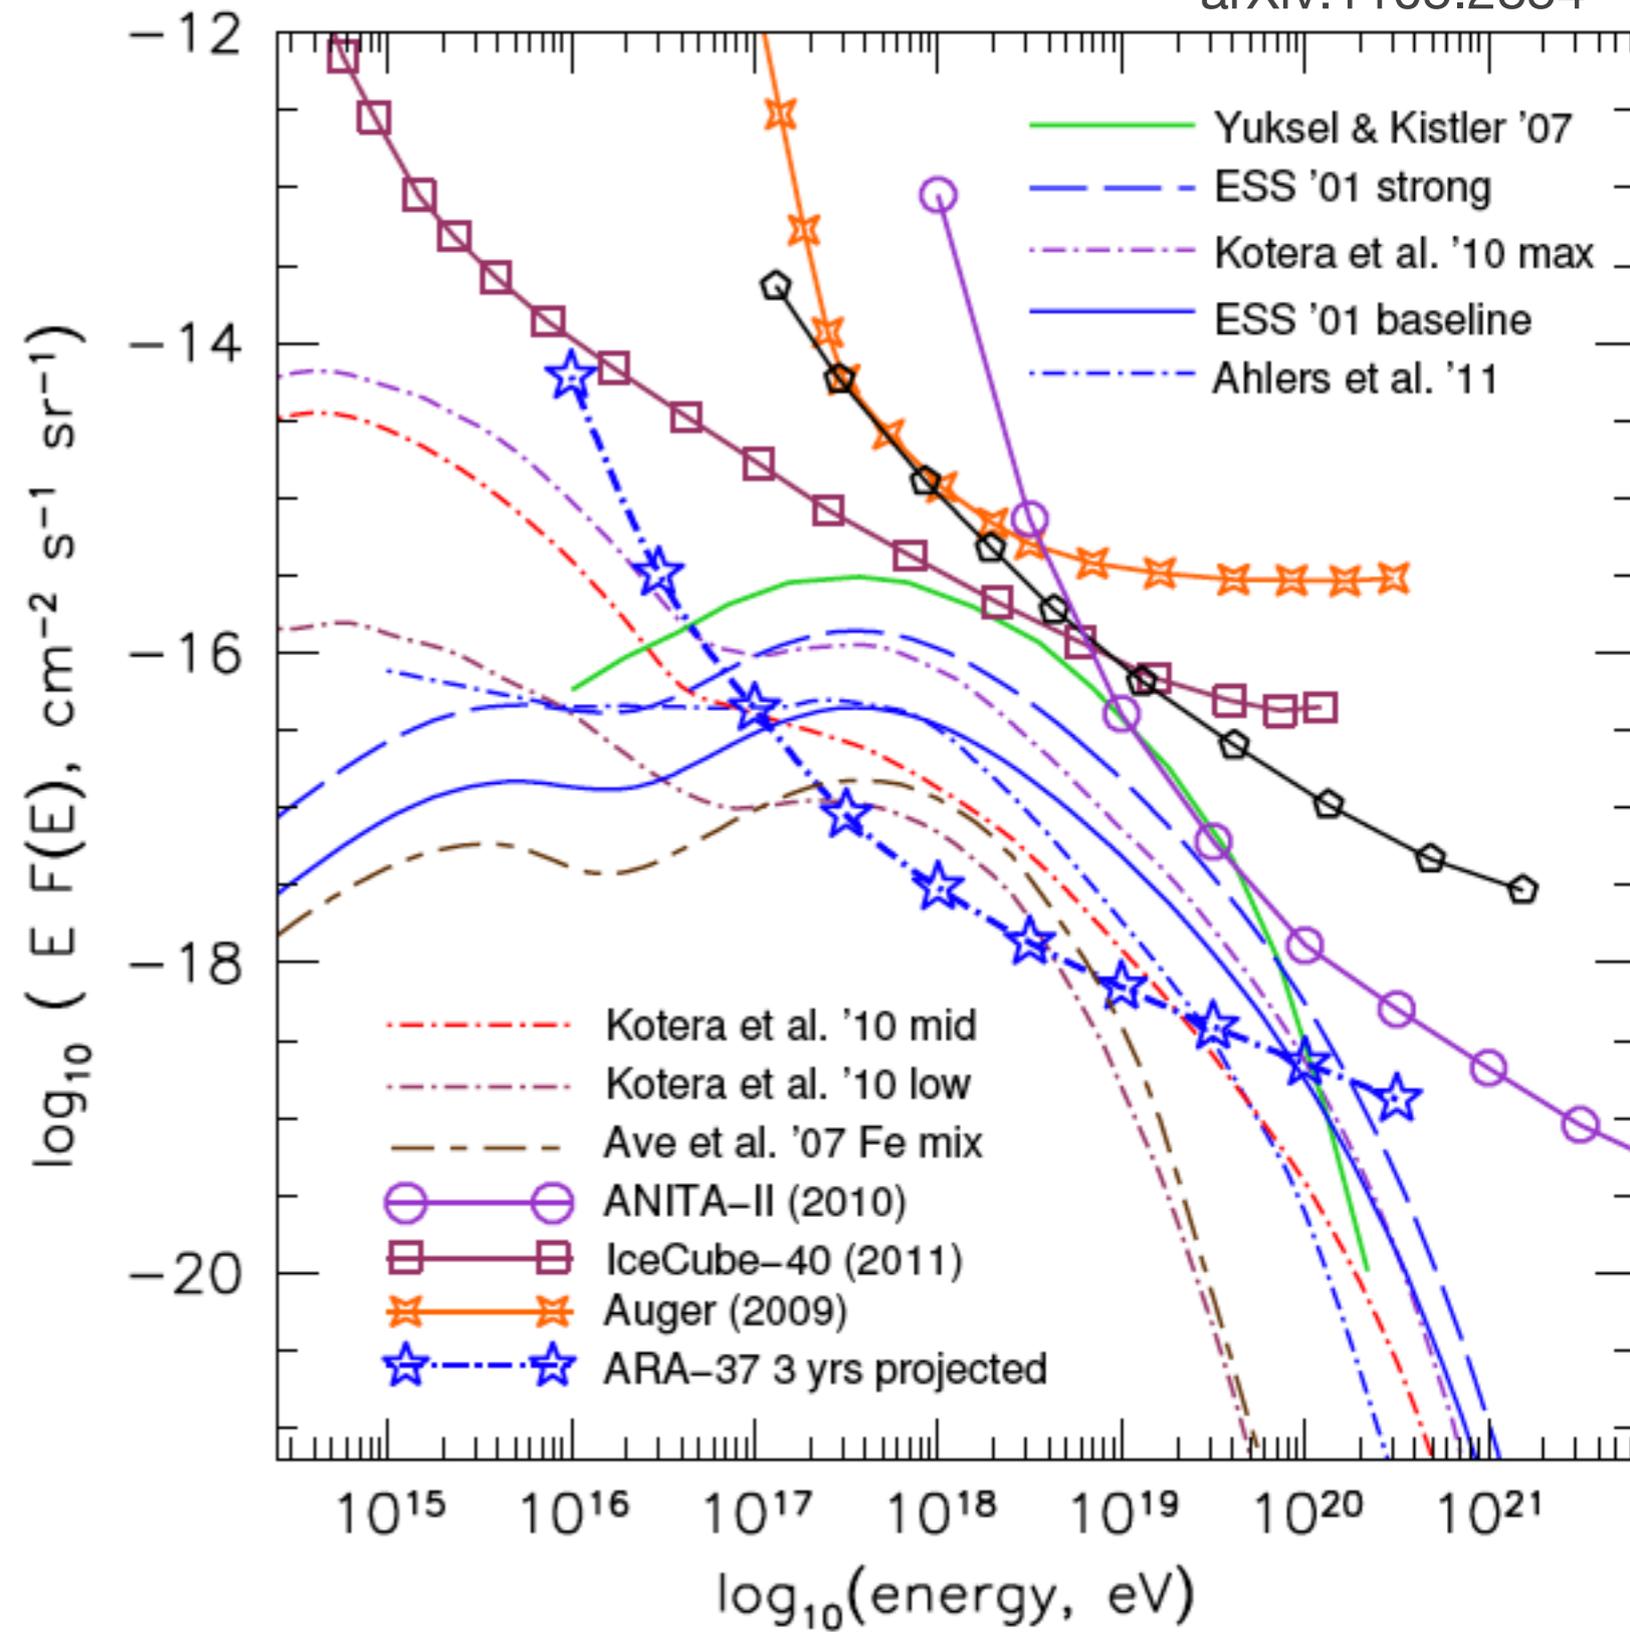

- Askaryan effect is where high energy particle in a dense medium produces coherent (polarized) radio emission
- Askaryan effect is where high energy particle in a dense medium produces coherent (polarized) radio emission

ANITA

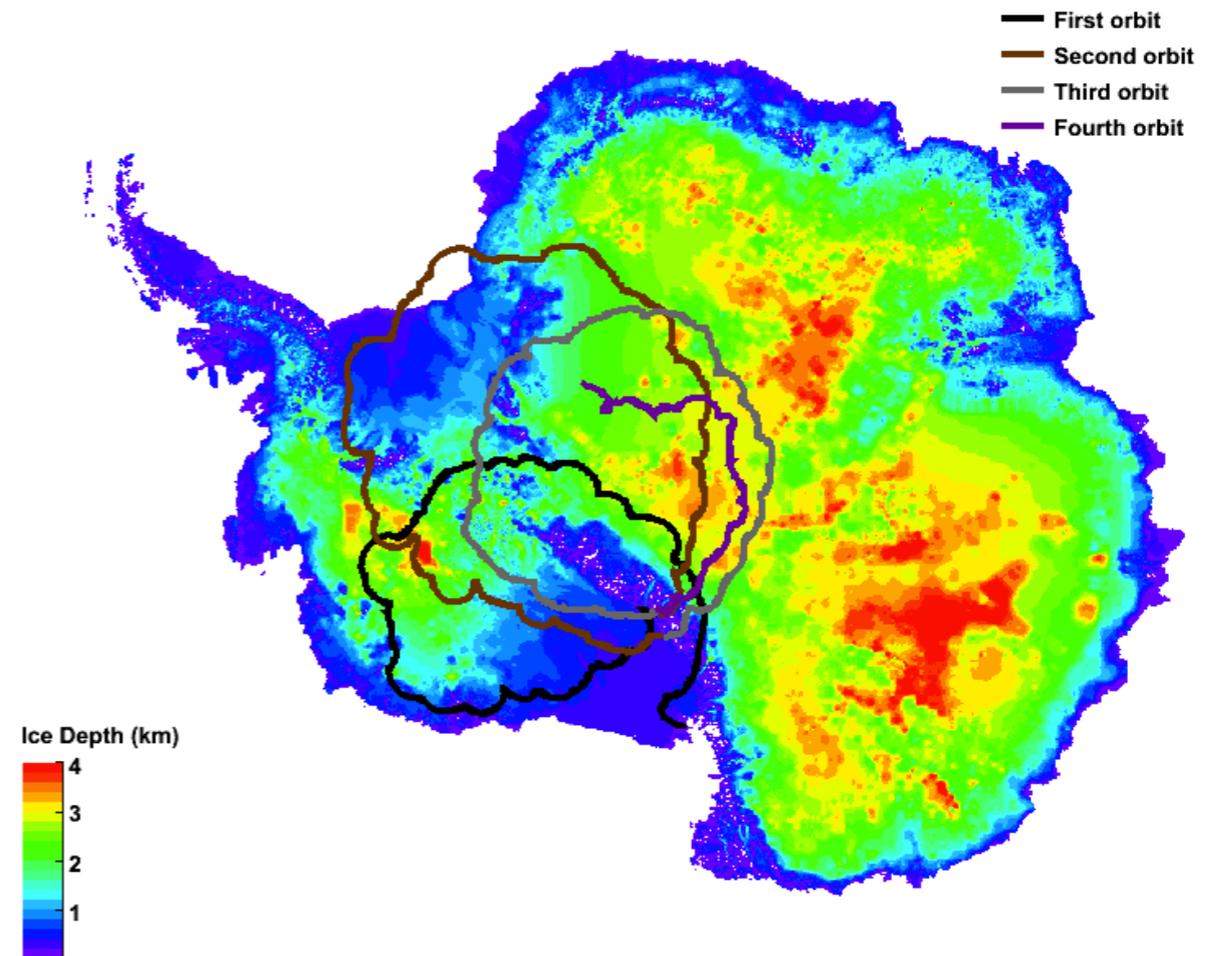

arXiv:1105.2854

ANITA

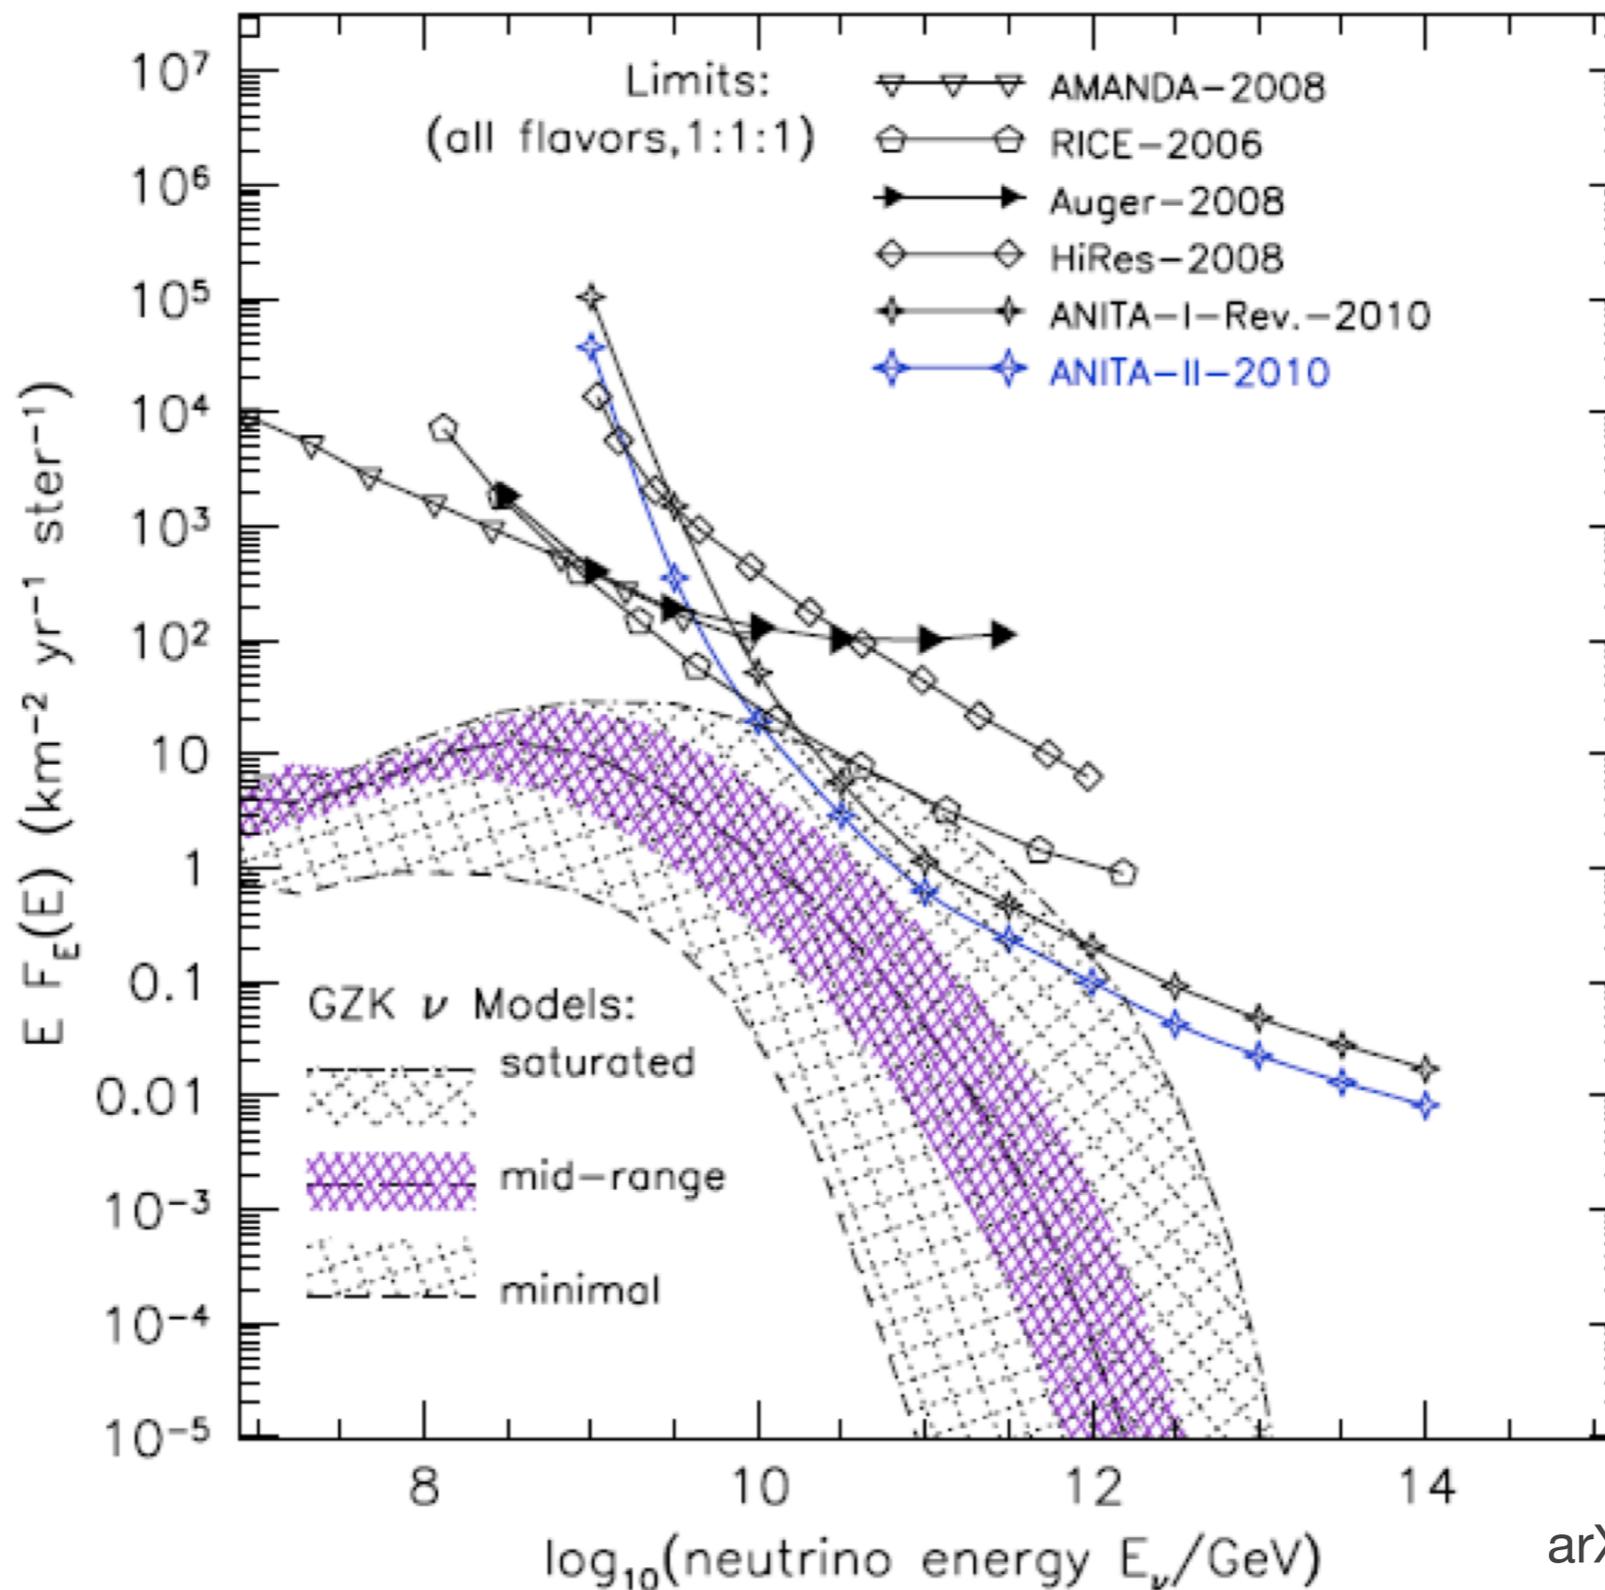

- First two flights are done
- ANITA-III
 - 5x improvement in sensitivity
 - Planned flight in Dec. 2014

	ANITA-I	ANITA-II
Neutrino Candidate Events	1	1
Expected Background	1.1	0.97 +/- 0.42

Counting neutrinos

A high-energy neutrinos constantly stream through all objects on Earth. Occasionally, a neutrino hits the nucleus of atoms and generates a blast of particles, generating a pulse of radio emissions that can be recorded. Here is a look at why the antarctic is a good place to monitor those radio emissions:

NEUTRINOS ENTER ICE

1 Countless neutrinos enter the ice, a few occasionally strike hydrogen and oxygen atoms in the ice.

COLLISION IN ICE

2 The force of the collision blasts particles from the nucleus of the atoms. The spray of particles emit radio waves in the form of a "cone" that points in the same direction that the neutrino was moving.

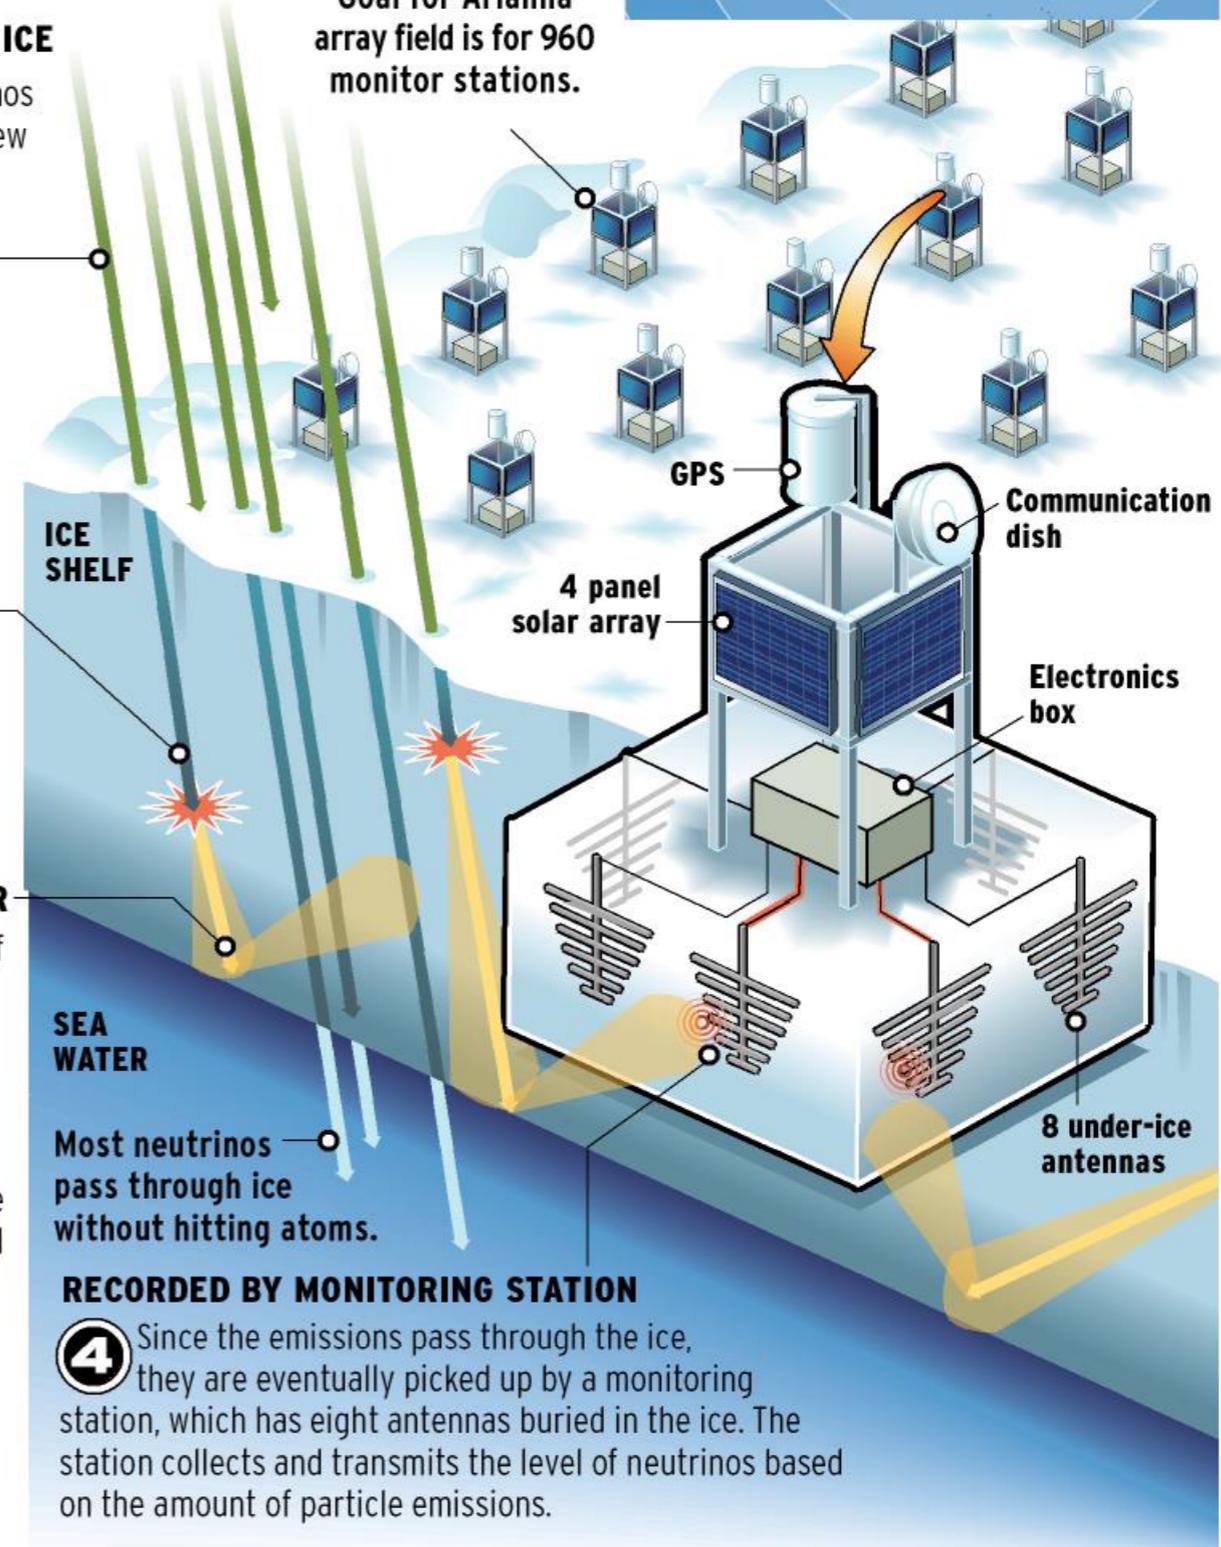

BLOCKED BY WATER

3 The Ross Ice Shelf is ideal for monitoring these emissions due to the water below the ice blocking the radio emissions. They bounce off the water and travel back through the ice.

Source: UCI Professor Steven Barwick

Graphic by Scott Brown / The Register

Goal for Arianna array field is for 960 monitor stations.

Most neutrinos pass through ice without hitting atoms.

RECORDED BY MONITORING STATION

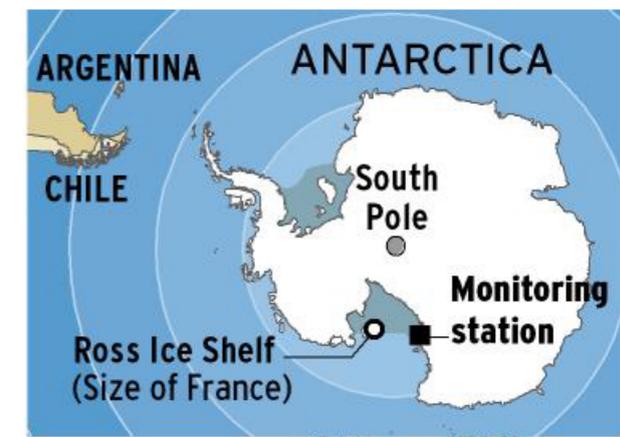

4 Since the emissions pass through the ice, they are eventually picked up by a monitoring station, which has eight antennas buried in the ice. The station collects and transmits the level of neutrinos based on the amount of particle emissions.

ARIANNA

- Reflected pulse very similar to direct pulse
- Free from RF interference
- Enhanced signal from reflection

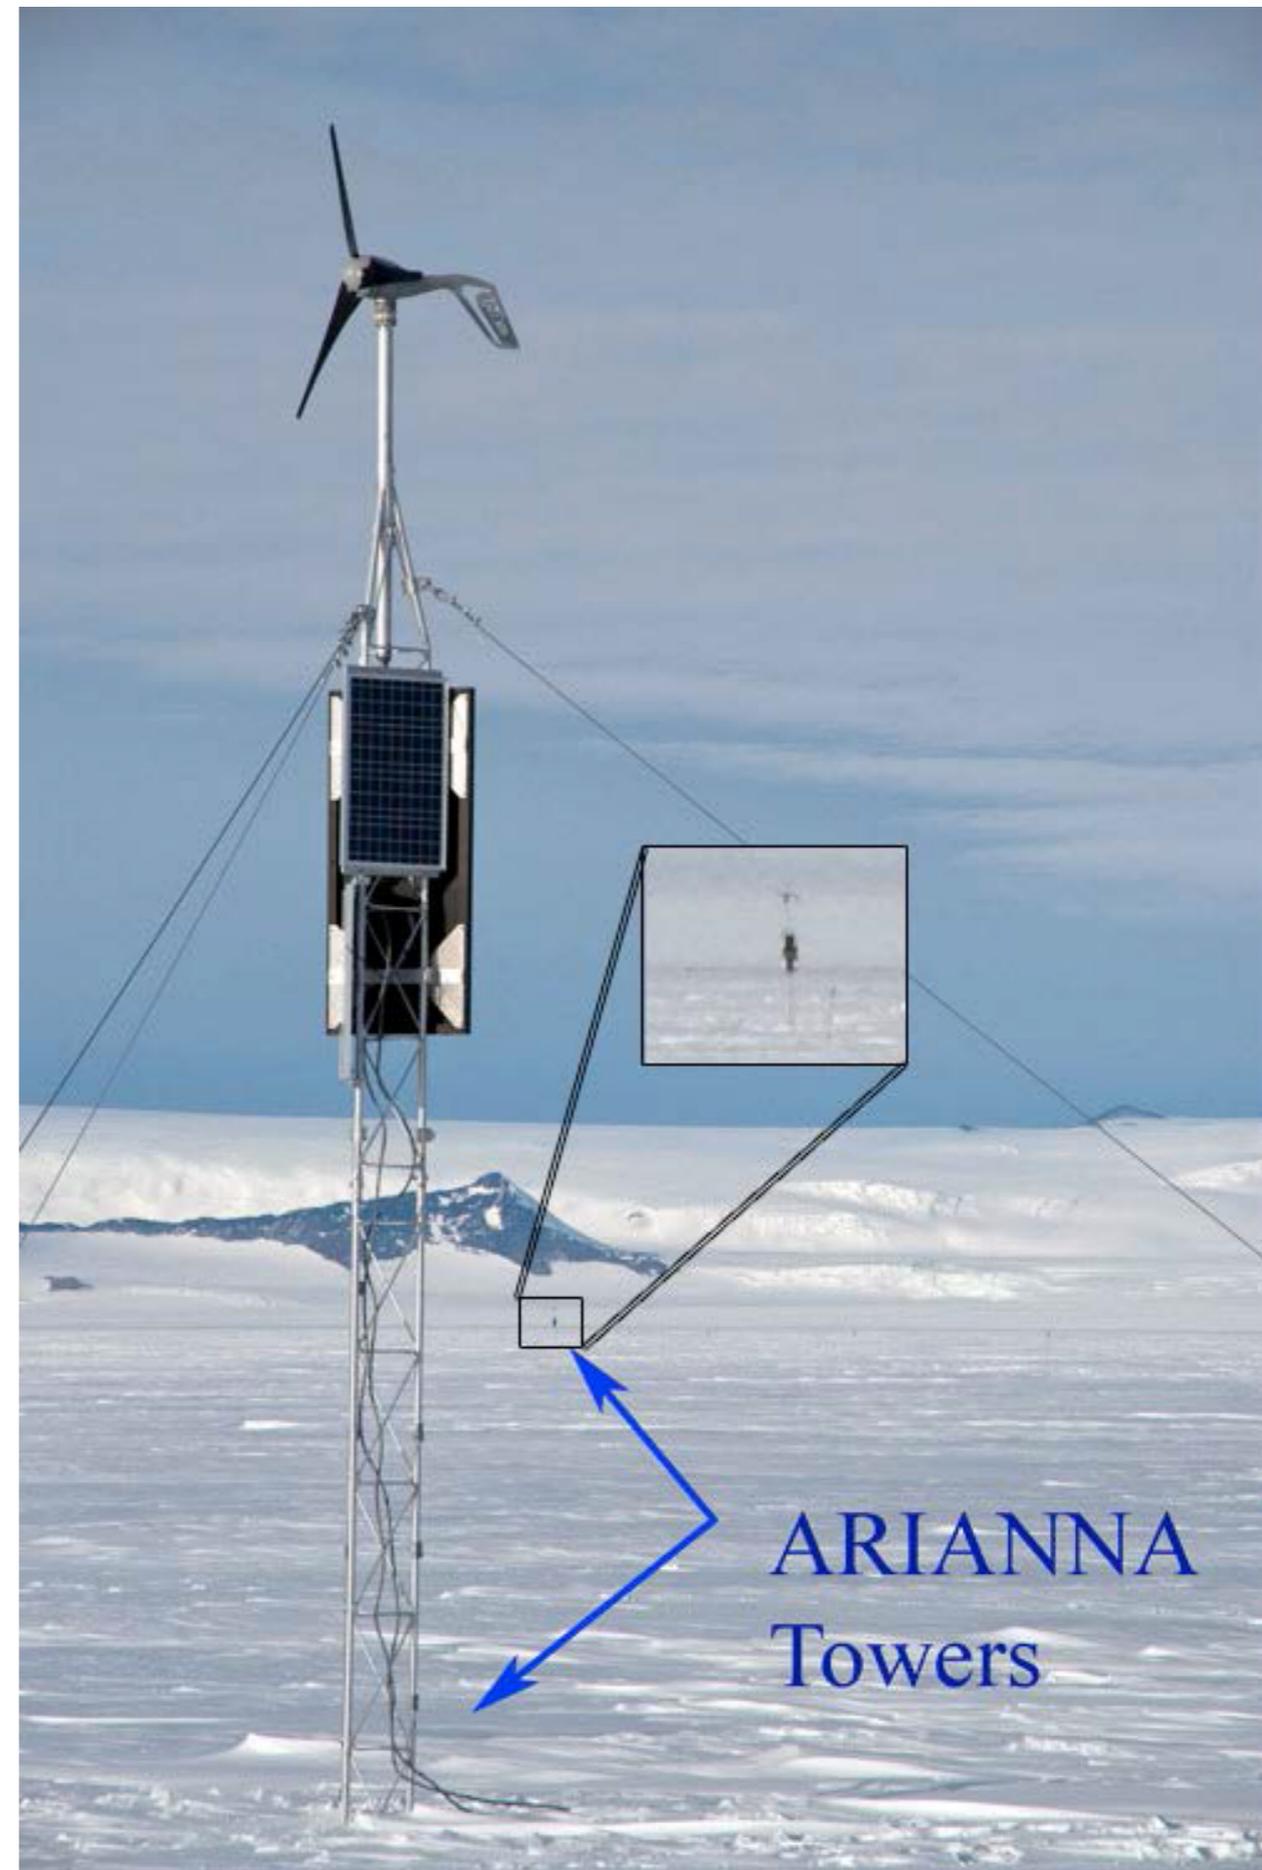

*S. Barwick, UCI

Power

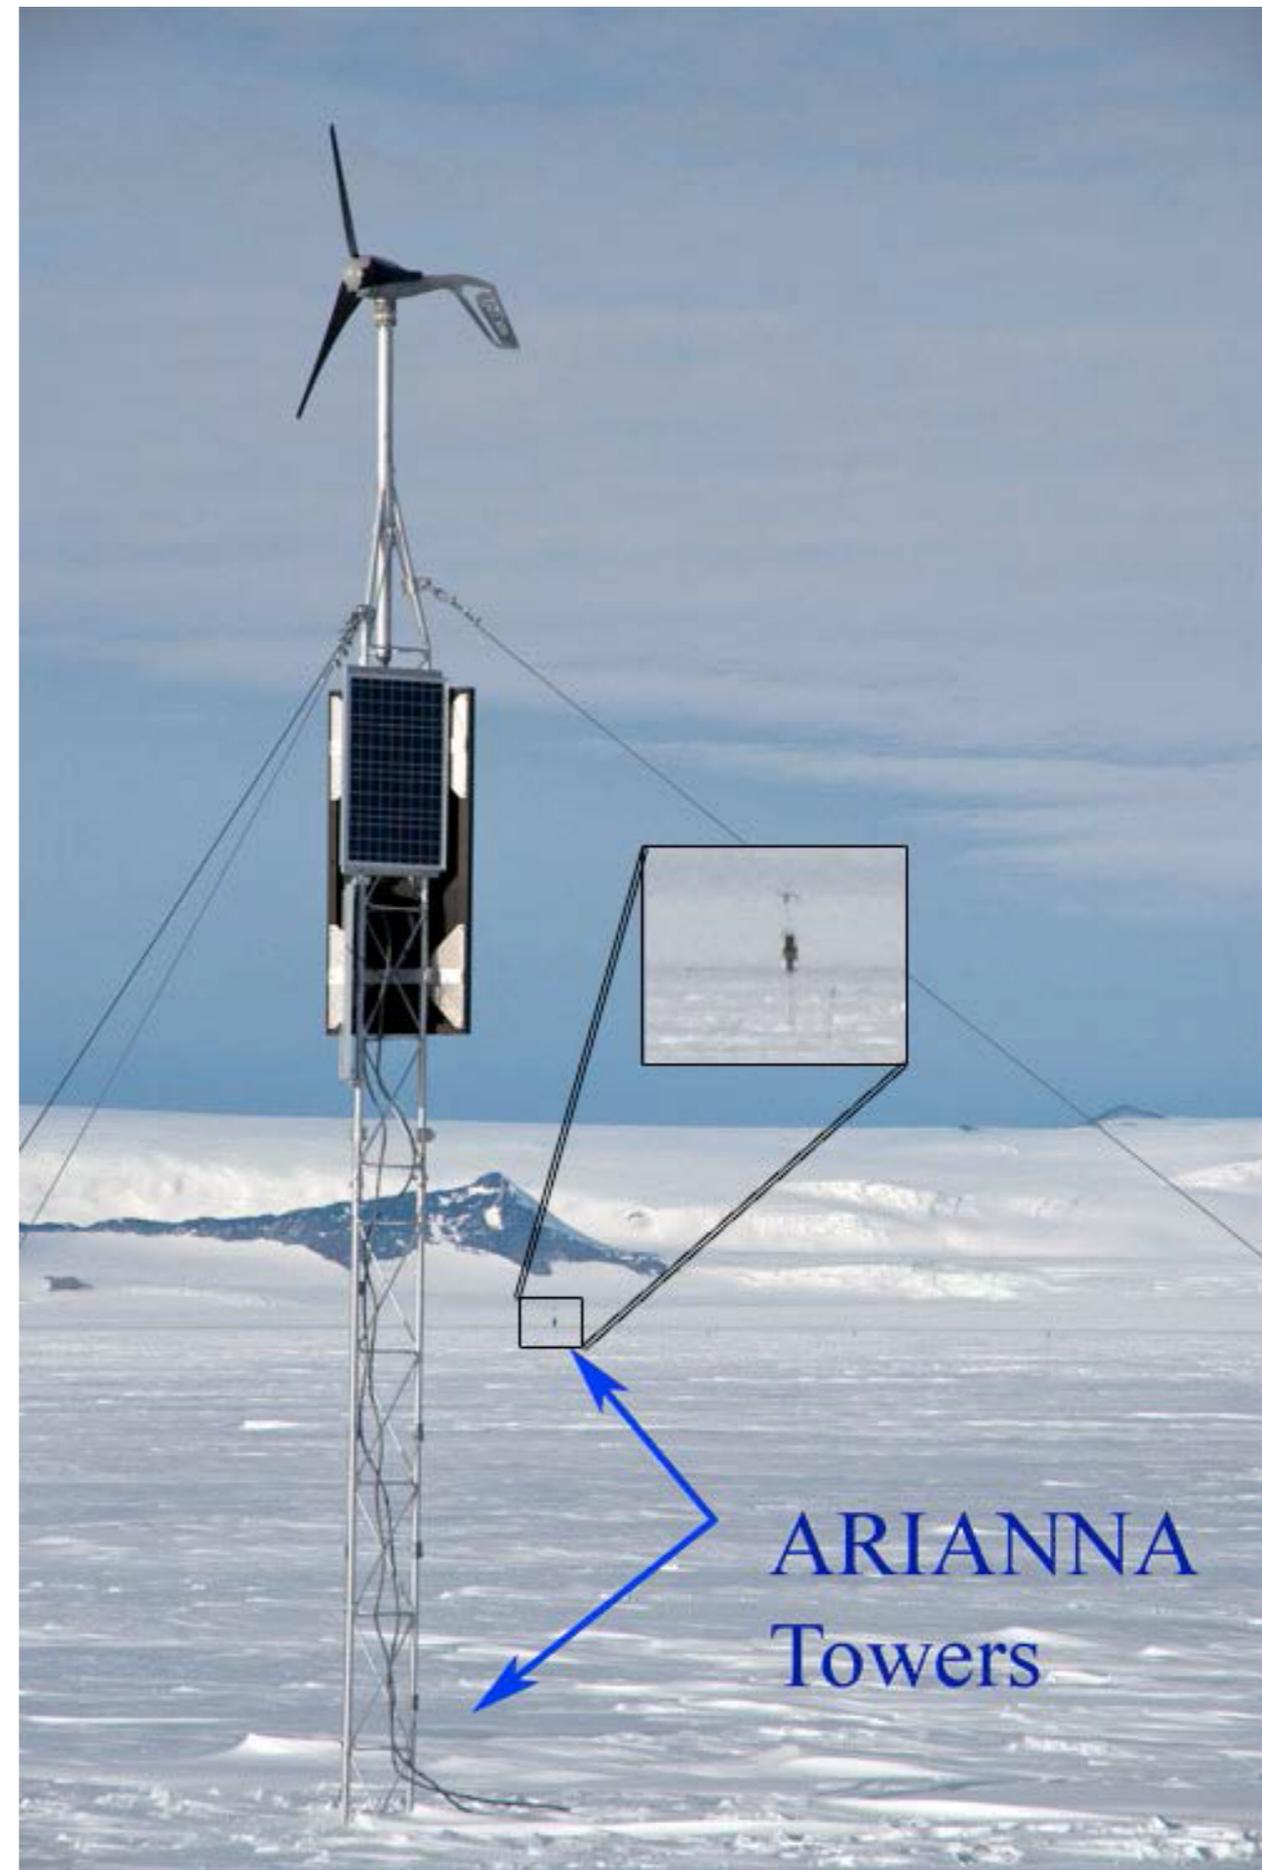

Power

- Summer tests showed 1.45A from tower

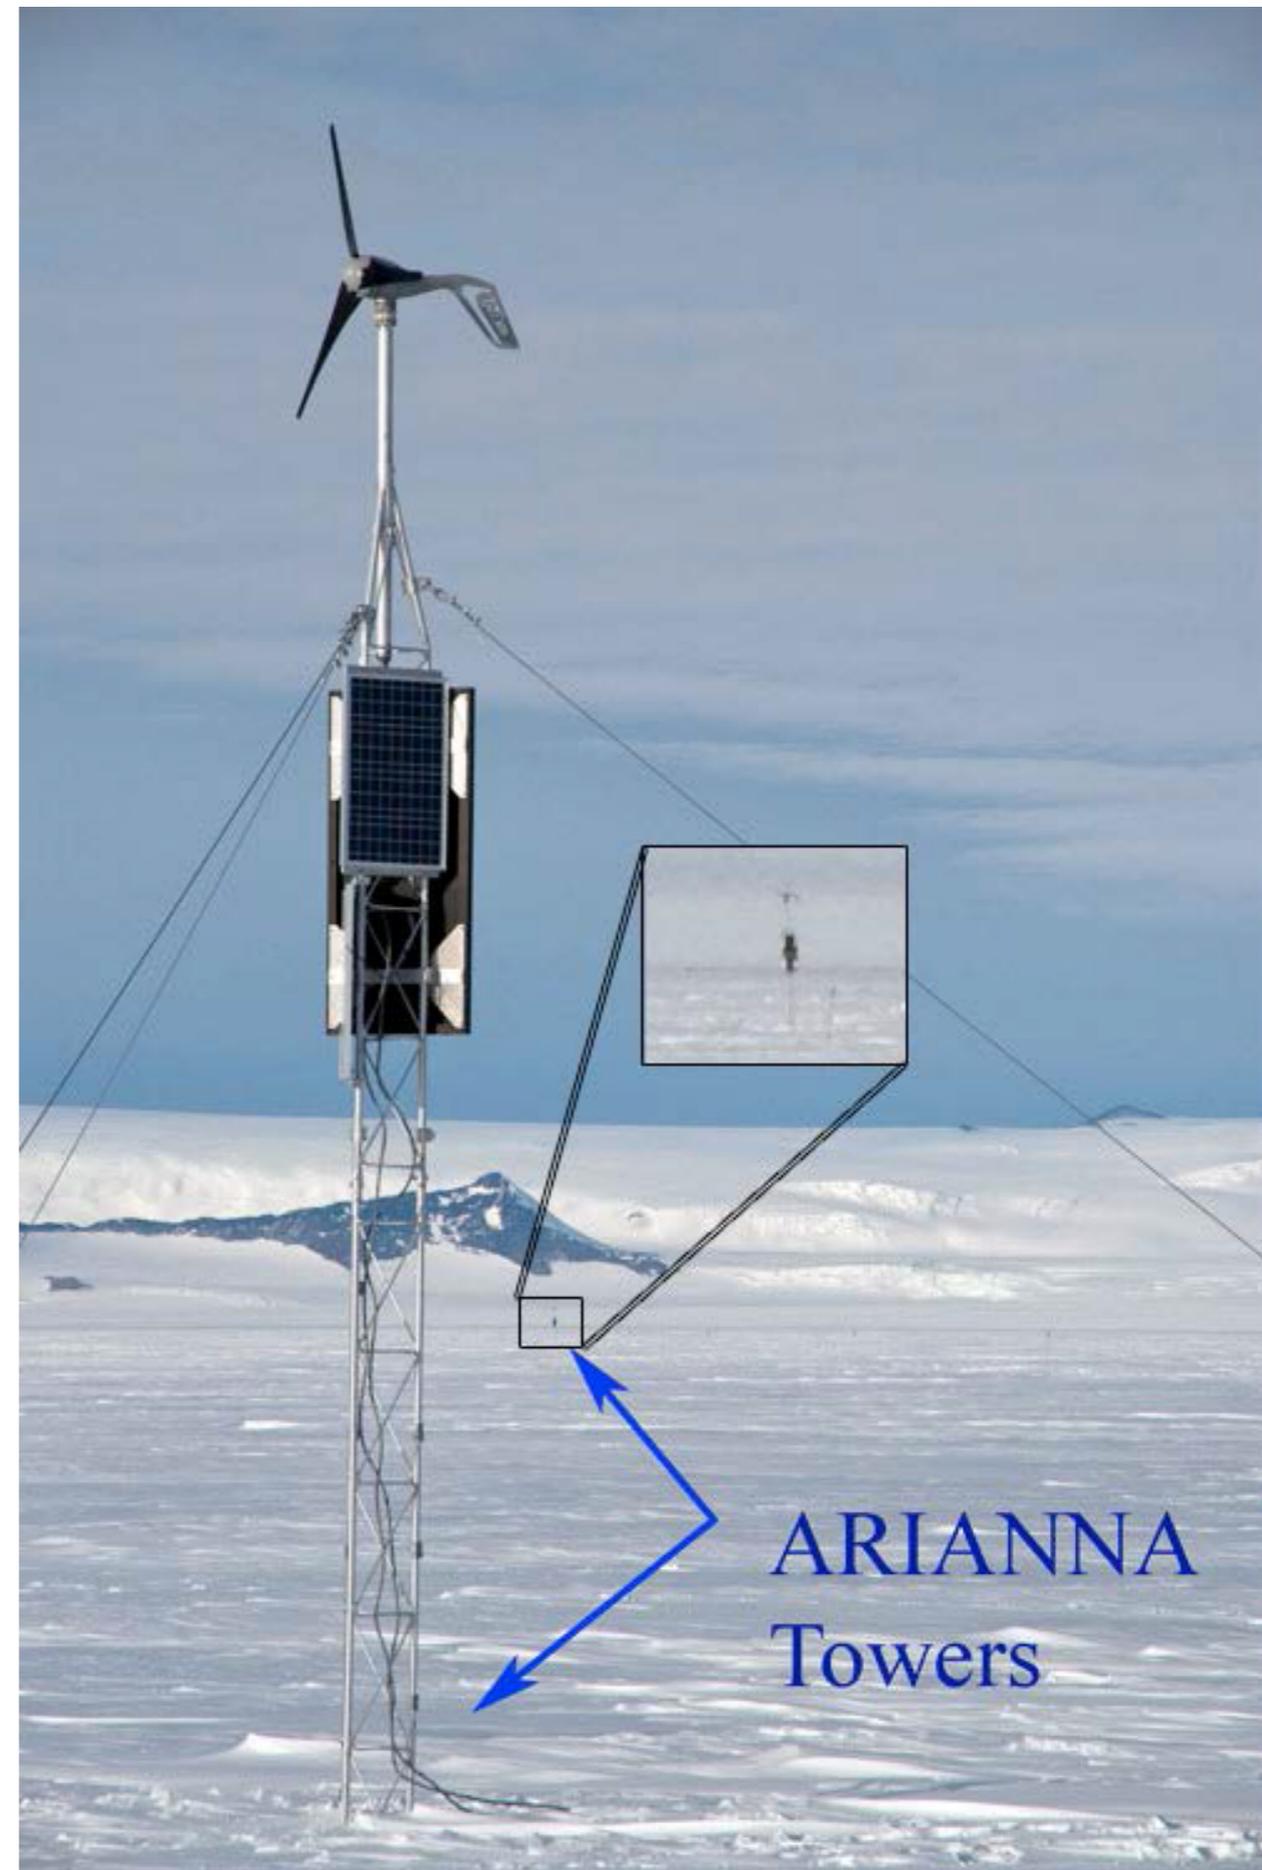

Power

- Summer tests showed 1.45A from tower
- Station requires 0.9A

Power

- Summer tests showed 1.45A from tower
- Station requires 0.9A
- Issues
 - Winter reduces efficiency due to cold
 - Low wind contingency

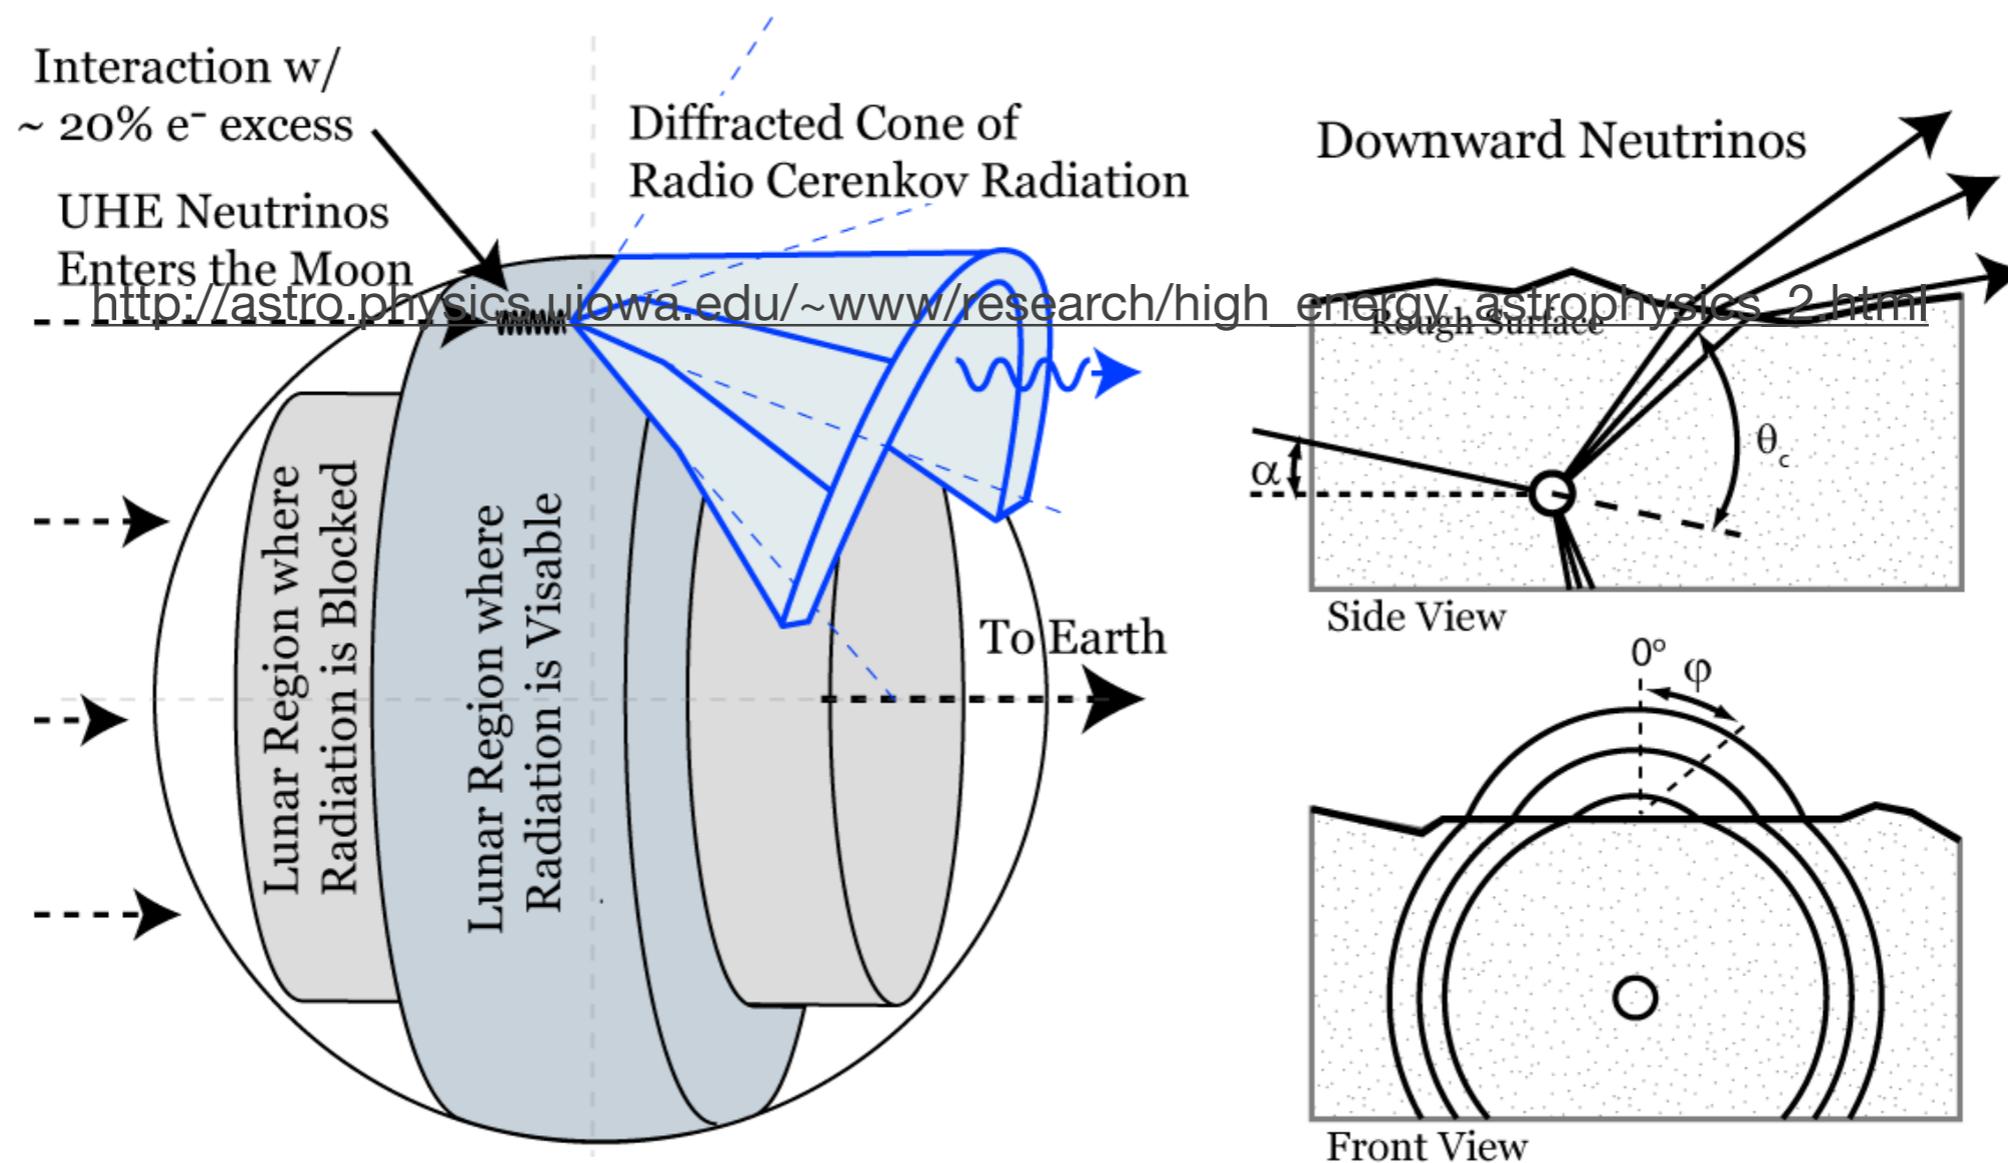

Other Options

Other Options
